Chapter 6

Examples

Confirm Assembly Rotation Entry

The following tables detail the rotation entries required for Bonded and duty paid stockrooms in Confirm Assembly:

Interactive Confirm Assembly:

		Lot Controlled Item	Non-Lot Controlled Item
Bonded Stockroom	Rotn req @ desp = '0' <i>(only available in EPD Stockroom)</i>	No lot no. entry field Rotn 'automatically' selected	No rotn no. entry field Rotn 'automatically' selected
Bonded Stockroom	Rotn req @ desp = '1'	Rotn no. must be entered	Rotn no. must be entered
Duty Paid Stockroom		Lot no. must be entered	No lot no. to be entered

Batch Confirm Assembly:

		Lot Controlled Item	Non-Lot Controlled Item
Bonded Stockroom	Rotn req @ desp = '0' <i>(only available in EPD Stockroom)</i>	Will be assembled Rotn 'automatically' selected	Will be assembled Rotn 'automatically' selected
Bonded Stockroom	Rotn req @ desp = '1'	Will not be assembled	Will not be assembled
Duty Paid Stockroom		Will not be assembled	Confirm Assembled

Customs Duty Calculation

The following equations and examples show the way in which Customs Duty is calculated for Beer, Wine and Spirits.

Beer

Strength Rate Duty:

$(\text{Strength Rate} * \text{Variant Strength} * \text{ECU Conversion Rate} * \text{Vol. of Liquid}) / 100 =$
Duty per Litre of Alcohol in Base Currency (remembering that Variant Strength is a percentage).

Volume Rate Duty:

$(\text{Volume Rate} * \text{ECU Conversion Rate} * \text{Vol. of Liquid}) / 100 =$ Duty per Hecto
Litre, in Base Currency.

Commercial Value (Ad Valorem) Duty:

$\text{Ad Valorem Rate} * (\text{Goods Cost} + \text{Insurance Cost} + \text{Freight Cost}) / 100 =$ Duty on
the Commercial Value (costs in base currency, extended by Movement Quantity).

Customs Duty:

$C = ((A + B * \text{Volume of Liquid}) / 100) + D.$

Where:

$A = \text{Strength Rate} * \text{Variant Strength} * \text{ECU Conversion Rate}.$

$B = \text{Volume Rate} * \text{ECU Conversion Rate}.$

$D = \text{Ad Valorem Rate} * \text{Total Cost} / 100.$

Wines and Spirits

Strength Rate x Strength x ECU Factor = Extended Strength Rate (£.pp per litre of alcohol).

Volume Rate x ECU Factor = Extended Volume Rate (£.pp per hecto litre of volume).

(Ext Strength Rate + Ext Volume Rate x Volume of Liquid/100 = Customs Duty (£.pp) (Half adjusted).

Note: Some Spirits may have both Strength and Volume rates, other Spirits only have Strength Rates; Wines only have Volume rates.

Example:

Strength Rate: $16.00 \times 40 \times .8 = 512$

Volume Rate: $205.00 \times .8 = 164$

Duty: $512 + 164 \times \text{Volume of liquid 18 Litres (2 Cases)} = 12168/100 = £121.68$

Excise Duty Calculations

The following equations and examples show the way in which Excise Duty is calculated for Beer, Wine and Spirits.

Beer

Volume of liquid (litres) x Strength x Strength Rate (per hecto litre %)/100

Note: Volume of liquid is after deduction of the unusable portion.

Example:

100 litres beer, less 10% unusable = 90 litres liquid.

Strength = 5%

Strength Rate = £10 per hecto litre %

For approximately £240 Beer at Retail:

Volume x Strength x Strength Rate = $90 \times 5 \times 10/100 = £45$ Excise Duty.

Wines and Spirits

Alcohol per case (from Variant) x Desp Quantity = Volume of Alcohol (litres).

Litrage x Quantity = Volume of Liquid (litres).

Vol of Alcohol x Strength Rate = Strength Duty (litres) (£.pp).

Vol of Liquid x Volume Rate / 100 = Volume Duty (litres) (£.pp per hecto litre).

Strength Duty + Volume Duty = Excise Duty.

Example (Wines):

1 Case of 12 x 75cl Bottles:

Litrage x Quantity = Volume of Liquid.

9.00 lt x 2 Cases = 18 lt

Volume x Volume Rate = Excise Duty.

18 lt x £205.00 (per hecto litre) / 100 = £36.90 Duty (on 2 cases of wine)

Example (Spirits):

1 Case of 12 x 75 cl Bottles @ 40%:

9.00 lt x 40% = 3.6 lt of Alcohol per Case.

Sell 2 Cases:

Alcohol x Quantity = Volume of Alcohol.

3.6 x 2 = 7.2 lt

Volume of Alcohol x Strength Rate = Excise Duty.

7.2 lt x £16.00 per litre = £115.20 Duty (on 2 Cases of Spirits).
