Chapter 11

Utilities

Drinks Sales Order Processing Utilities

Drinks Sales Order Processing Utilities provide assistance with set-up, housekeeping and database integrity.

Warning: In general these procedures require exclusive use of the company, or sometimes the whole application, in order to run. It is therefore strongly recommended that the authority to run these procedures is restricted to perhaps two or three people who have responsibility for the whole system.

Note: A warning message is displayed when exclusive use of the application is required but cannot be achieved.

This might be caused by jobs which are finished but not de-allocated. The most likely cause of this situation would be the cancellation of jobs whilst active or on the job queue, or a system crash occurred.

This can be corrected by using the option VERIFY ALLOCATIONS.

Copy Company Utility

1... **2...** 2/DOU

This utility is used to create a new sales order company within the Drinks Sales Order Processing application. The company profile data is copied from the nominated company. Any differences for the new company can then be entered by using the standard maintenance procedure.

Copy Company Utility Selection Screen

Select the Copy Company option.

Fields:

Company Range

Both the from and to company codes must be entered. The from company must be a valid Drinks Sales Order Processing company and the to must have been set up as a Drinks Inventory company and as an Accounts Receivable company.

Press **Enter** to submit a batch job to create the new company profile record.

Delete Company Utility

3/DOU

Select the Delete Companies option.

The purpose of this procedure is to remove data from the application for one or more selected companies. The process is performed in three steps:

- Copy data for the companies to be **retained**, to a temporary library.

Warning: Only 50 companies can be selected for retention.

- Clear the physical files in the **live** library.
- Copy back the data from the temporary library.

The following action is required:

On the first screen enter the libraries that contain the data for deletion.

Note: If bespoke libraries are present this option must be run separately for each library.

Press **Enter** to continue.

A list of existing companies is displayed - select the companies to be deleted by entering a 1 against them.

Press **Enter** to continue.

Confirmation is required to submit the procedure to the job queue, this is done by pressing **F8=Submit**. A batch job will be submitted to delete the companies. Depending upon the volume of data, this could be a long process.

Functions:

F16

Override (None Selected error). If no companies have been selected this allows the company deletion to continue but without deleting any companies.

Background Jobs

10/DOU

Select the Background Jobs option to display the Background Processing Menu.

Background jobs can be run from the Background Processing Menu.

DOX	DK - QA Drinks	User GBJBA1MS	29/10/97 09:11:09
Background Processing			
Subsystem			
1. Start subsystem			
2. End subsystem			
Background Processing			
11. Start automatic allocation		21. End automatic allocation	
12. Start proforma invoice print		22. End proforma invoice print	
13. Start bond despatches		23. End bond despatches	
14. Start reservations monitor		24. End reservations monitor	
15. Start stock monitor		25. End stock monitor	
90. Signoff

Search _____			
F3=Exit F4=Prompt F6=Messages F12=Previous F16=Change company F18=Prints			
21-11 * MW KS IM DM II EDN400R KB ST0672S1			

The following jobs may be run in the background from the Background Processing Menu:

- Start and End automatic allocation. This is required to allocate orders released from suspension or when delivery dates are changed.
- Start and End proforma invoice print. This is used to print proforma invoices if requested at order entry.
- Start and End bond despatches. This is used to run bond duty calculations and bond FIFO duty uplift, and batch confirm delivery.
- Start and End reservations monitor. This is used to allocate purchase order receipts to orders where back to back processing is performed.
- Start and End stock monitor. This is used to control the availability of lots when enhanced lot control is being used.

Note: In order for Duty Uplift to work, Start Bond Despatches must be used at the beginning of every day, and end bond despatches must be used at the end of every day.

Note: If you are using enhanced lot control, Start Stock Monitor must be used at the beginning of every day, and End Stock Monitor must be used at the end of every day. This is required to correctly maintain the stock status of lot, batch

and serial controlled items.

Each of the options is a command in itself, requiring nothing but selection with the exception of Start Proforma Invoice print.

The Start Proforma Invoice Print option, presents a window to confirm your choice of action.

The automatic allocation process is used to allocate stock to released suspended orders, and orders where the delivery date is amended. The proforma invoice print prints proforma invoices as and when requested at order entry or amend.

Re-create Customer Search Index Utility

21/DOU

In order to help identify customers within the application an alpha search is provided. This search operates on the words or part words of the customers name. In addition, two extra fields from the customer record can be selected to be used as search arguments. These are defined on the Company Profile.

Warning: If any of the criteria are changed, or it is believed that the index has become corrupted, you must run this procedure so that all existing customers will have their new index entries created.

There are no selection criteria. Following selection, the screen to confirm processing a batch job is displayed. Press **F8=Submit** to submit the job to the job queue.

Archive Orders / Invoices Utility

22/DOU

Select the Archive Orders / Invoices option.

This procedure enables a reduction in the size of the Sales Order Processing database. The archive process has three stages. This option performs only the first stage.

- Purge order and invoice data from the live files and write them to a set of history files.
- Back up the history files to an off-line medium and clear the history files.
- Reorganise the following files:
 - **INP40** Text File
 - **OEP40** Order Header
 - **OEP45** Order Address Overrides
 - **OEP50** Order Charges
 - **OEP55** Order Lines
 - **OEP65** Invoice Header
 - **OEP70** Invoice Line/Order Analysis
 - The following are also re-organised; OEP60, INP56, INP57, INP58, OEP50E, OEP70E, OEP42, OEP43, OEP56, OEP57, OEP72, OEP73, INP62.

The following criteria must be met in order that records are archived:

- The order must be complete or cancelled.
- The invoice must have been paid in Accounts Receivable.
- The processing date (of completion, cancellation or payment) must be prior to the nominated date.

A screen is displayed requesting the target date.

Tip: The default date is one year prior to the current date. This may be changed.

Functions:

F11

Submit job to the queue

Data is added to the corresponding history files.

Press **Enter** to validate the date.

You are asked to confirm the run. Press
F8=Submit to submit the job.

Back Orders To Order Lines Utility

1... 33/DOU - UPDATE
2...

1... 34/DOU - NO UPDATE
2...

If a hardware or power failure occurs, it is possible that the back order figures in Drinks Inventory Management, and the allocated order values in Accounts Receivable may become out of line with the equivalent Drinks Sales Order Processing order file figures.

A back order is an order which should have been allocated to meet the customer's delivery date, but has not because there is insufficient stock available. The sum of the back orders at any time is held on the stockroom balance record for the item per depot. This balance is used in the calculation of EXPECTED stock. This utility can calculate the total of back orders for all depots and update the inventory stock balance totals. It may be run in two modes, each with its own option, these are:

- Report and update.
- Report only.

The report lists the discrepancies found between actual back orders and the stock balance total. The update option corrects the stock balances.

The report is titled Back Orders on Stockroom vs. Order Lines and contains the following details:

- Item Code & Description.
- Stockroom.
- Back Order Quantity.
- Quantity Outstanding.
- Variance between the outstanding and back order quantities.

Following selection, the standard screen to confirm processing a batch job is displayed.

The back order balance is calculated as the total of the outstanding order balance (less the reserved balance) for all order lines with a due date within the allocation time fence.

It ignores lines for tagged goods orders and uplift orders, order lines for customers requiring booking-in but with a zero booking-in time, suspended fully outstanding order lines and EDI orders.

Accounts Receivable Order Value To Allocated Order Utility

35/DOU - UPDATES

36/DOU - NO UPDATES

As part of credit management, it is necessary to value the immediate commitment in terms of the allocated stock to a customer. This is the value by which a customer's credit will increase if no action is taken to stop it. This value is held, with the other financial balances for the customer, in Accounts Receivable.

This utility calculates the stock allocated to customers, both printed on picking notes and not yet printed, and compares the result with the total held on the customer's Statement Account Balance, in Accounts Receivable. The Accounts Receivable balance is updated if any discrepancies have been found. It may be run in two modes, each with its own option, these are:

- Report and update.
- Report only.

The discrepancies found are listed on a report.

Following selection, the standard screen to confirm processing a batch job is displayed.

The report is titled O/S Order Value vs. Allocated Orders and contains the following information:

- Statement Code & Description.
- Customer Balance.
- Customer Order Total.
- Variance between the balance and order total.

Goods Despatched Not Invoiced Reconciliation Utility

1...
2...

37/DOU - UPDATE

1...
2...

38/DOU - NO UPDATE

The account summary balance update function takes account of any orders despatched where the invoice has been generated, but the invoice print and posting has not yet been run.

To ensure that the balances are maintained this option will generate a listing of discrepancies, between goods despatched without invoices compared to sales ledger invoice headers. The option is split as two options.

- Report and update balances.
- Report only.

Following selection, the standard screen to confirm processing a batch job is displayed.

The report is titled AR Goods Despatched Not Invoiced vs. Invoice Header Value and contains the following information:

- Statement Code & Description.
- Customer Balance.
- Customer Invoice Total.
- Variance between the balance and invoice total.

Rebuild Hierarchy Accounts Balance

39/DOU

Hierarchy accounts need to be monitored to ensure that credit balances are in line for all customers, under a parent account.

The summary balances are also updated, when the report is generated.

From the selection, the standard screen to confirm the process a batch job is displayed.

The report will contain a before and after picture, in both prime and base currency, of outstanding orders and despatched goods that have not been invoiced, to a customer.

Customer Additional Details

1... 40/DOU - VALIDATE
2...

1... 41/DOU - UPDATE
2...

You use these two options when you transfer customer details into System 21, from other computer systems.

If you acquire a large amount of data from another company that has customer details stored on its computer system, the cost of re-entering these details into System 21 manually could be considerable.

You can download data into the OEP15 interface file and, using these two options, validate and load this data into the System 21 Sales Order Processing Customer Details database. Customer sales details and invoice details then appear in the system as if they were entered manually.

You will need to create bespoke software to populate the OEP15 interface file with the customer sales details.

Validate

You use this option to validate the data in the OEP15 interface file.

This option submits a batch job that validates the data in the OEP15 interface file. The validation applied to this data is the same as that applied to data entered manually via the Sales Order Processing Customer Maintenance options.

Any detected errors are reported.

Update

You use this option to update the Sales Order Processing Customer Details database with the validated data.

This option submits a batch job that creates the customer sales details and invoice details from the validated data. Only data records that have no detected errors are used to create these new customer details.

AFI Interface

55/DOU - TEST

56/DOU - INSTALL SOP / AFI LINK

AFI provides comprehensive facilities for posting invoicing and inventory movement information to General Ledger. If AFI is not installed, links to General Ledger are still available via BFI (Basic Financial Integrator). The Company Profile indicates which type of link is to be used.

There are two relevant options which relate to the Advanced Financial Integrator - Test Invoice Extract and SOP/AFI Link installation.

Note: The Live Extract facility is called directly from the SOP Invoice Print, so is not described here.

These two options must be run in conjunction with the AFI application itself. Please refer to the AFI Product Information for general details - information given here is specific to Drinks Sales Order Processing.

Before the AFI link can be used, Drinks Sales Order Processing must be recognised by AFI. This is done by installing the SOP / AFI link, which enables journal and rules relating the Drinks Sales Order Processing to be defined in AFI.

Test Extract

The AFI Test Invoice Extract option is used to undertake a trial extract of data from the source application (in this case Sales Order Processing) and create a General Ledger journal.

Note: No actual updating of data takes place, either within the source application or the General Ledger. It is purely a “paper” exercise to simulate the effect of creating the specified journals for the nominated company, and ensure that the rules that have been defined are correct.

Up to three reports are generated:

- A list of the General Ledger postings generated.
- An exception report showing, for example, any balancing postings automatically created for an unbalanced journal.
- An error report, showing any error conditions encountered.

Fields:

Source Company

Indicate the source company whose data is to be used for this trial extraction.

Include Only Invoices Not Already Extracted

Enter one of the following:

1 - If, for the purposes of this trial, you want to use only data which has not been extracted in live operation mode by AFI.

0 - If you wish to specify a range of transaction numbers on which the trial is to be based.

Include Invoices From And To

This is only relevant if the previous response was 0. Specify here the range of invoices in the source application to be used in this trial. If you wish to use only a single transaction, say a single invoice, specify the same number in the From and To entries. A window facility is available to display transactions within the source application which can be used for this trial.

Type Of Journal Definition To Use

There are three valid options here:

- 1 - Use only journal definitions which are specified as being under test.
- 2 - Use only journal definitions which are specified as being live.
- 3 - Use both test and live journal definitions.

Consolidate Postings

Consolidatable postings are financial transactions that can be merged together when the account code is the same.

1 - Consolidation to take place on those postings defined as consolidatable.

0 - No consolidation will take place, even though you may have postings defined as consolidatable.

Press **Enter** to validate the selection screen.

AFI Link

This section describes the link between AFI and the Sales Order Processing application.

Where AFI is linked to the Sales Order Processing application (AFI is set to active), invoice details are extracted at the point where updating to the Accounts Receivable takes place as part of the invoice print run.

Transactions are created in AFI for the invoices or credit notes in the batch just processed. These are posted to the General Ledger as journals in one of two ways:

- If the Automatically Update GL flag in the *Maintain Application* option is set to 1 or 2 then journals are immediately posted to the General Ledger following their creation.
- If the Automatically Update GL flag is set to 0 then no posting to the General Ledger occurs until the *AFI - GL Update* option.

If AFI is not linked to the Sales Order Processing application (AFI is not set to active) then sales invoices or credit notes are posted to the General Ledger by the standard facilities of AFI which are not accessible by the user. This alternative method of posting is known as the Basic Financial Integrator (BFI).

As well as the AFI link status being set to active, there must also be one or more live journals. The facility to set up a journal as live is part of the *Journal Conditions* option.

Note also that the journal condition field must be set to test for a valid value when reading data from the source application. For example, the journal condition field must be set up to test for the presence of invoices, credit notes or both. If your journal conditions do not cause an extract of invoices or credit notes to occur, then a warning message is displayed (for example, when the invoice or credit note transactions do not meet the selection criteria specified on your journal conditions).

Data Dictionary

The following files, and their associated fields, are available for defining how selection or consolidation is to take place.

Invoice Header

- Company Number.
- Customer Invoice Code.
- Customer Account Number.
- Customer Order Reference.
- Discount Group.
- Division.
- Invoice Number.
- Warehouse/Depot Location.
- Order Number.
- Order Type.
- Order Source.
- Salesman.
- Statement Account Number.
- Transaction Type (IN or CR).

Invoice Lines

- Company Number.
- Item Code.
- Customer Invoice Code.
- Customer Account number.
- Discount Group.
- Cash Discount Code.
- Division.
- Invoice Number.
- Warehouse/Depot Location.
- Order Number.
- Order Type.
- Statement Account Number.
- VAT Code.

Invoice Charges

- Company Number.
- Charge Code.
- Order Number.
- Invoice Number.
- VAT Code.

Parts

- Company Number
- General Ledger Cost of Sales Account.
- General Ledger Stock Account.
- General Ledger Price Variance Account.
- General Ledger Sales Account.
- Division.
- Feature Type.
- Item Class.
- Item Group Major.
- Item Group Minor.
- Item Code.
- Purchase/Packing Unit.
- Item Type.
- Sub-Division.
- Stock Unit.
- VAT Code.
- EEC Tariff Code.

Customer Master Details

- Customer Group 1.
- Customer Group 2.
- Customer Group 3.
- Customer Group 4.
- Customer Name.
- Company Number.
- Credit Control Responsibility.
- Customer Account Number.
- General Ledger Bank Account.
- General Ledger Debtors Account.

- Sales Region Code.
- Salesman Code.
- VAT Indicator.
- Prime Currency Rate Code.

Additional Customer Sales Details

- Branch.
- Customer Class.
- Company Number.
- Customer Account Number.
- Discount Group.
- Division.
- Price List Code.
- Warehouse/Depot Location.
- Region.
- Sub-Division.
- Salesman.
- Territory.

Stock Balance

- Item Type.
- ABC Classification.

The following fields are defined as quantities which are available to post, (refer to quantity field to post within posting definitions).

Invoice Lines

- Line Quantity (Stockroom Issue UOM).
- Line Quantity (Item Master Issue UOM).

In addition, for the purpose of Supporting US Sales Tax, the following files, and their associated fields, are available for defining how selection or consolidation is to take place.

Invoice Tax Header

- Company Number.
- Invoice Number.
- Order Number.
- Tax Body Code.
- Tax Body Type.

Invoice Tax Lines

- Company Number.
- Invoice Number.
- Order Number.
- Tax Body Code.
- Tax Body Type.

Invoice Tax Charges

- Company Number.
- Invoice Number.
- Order Number.
- Charge Code.
- Tax body code.
- Tax body type.

Tax Bodies

- Company Number.
- Tax Body Code.
- Tax Body description.
- Tax Body Type.
- Remit to Tax Body.
- Payment Frequency.
- General Ledger Account.
- General Ledger Account Extension.
- From Zip Code.
- To Zip code.

Price Results File and Price Element Breakdown File

These files are used by the system to hold the twelve price elements which are posted to the General Ledger when Price Element Breakdown is active.

Other Files

The following files, and their associated fields, are available for posting values to the General Ledger. In each case the normal sign (+ or -) is shown for each field as held within the Sales Order Processing application.

Activating the Link

Warning: It is strongly recommended that journal conditions are first set up as under test and that they are thoroughly proven using the AFI Test facilities before they are set to live and AFI is active.

Until such time as AFI is activated, posting of sales invoices and credit notes to the General Ledger continues to take place via the standard facilities of the Basic Financial Integrator. When AFI is set to active only from that point will postings to the General Ledger take place via AFI during each subsequent invoice or credit note run.

The steps required to be taken to activate AFI are as follows:

1. AFI Maintenance.

Use the *Maintain Journal Condition* option to change the status of your journal conditions from inactive (0) or under test (1) to a status of live (2).

This need not be done for all journal conditions - only those which you are ready to activate.

2. AFI Utilities.

Use the *Maintain Application* option to change the status of the AFI Link from BFI Mode to active using **F8=Submit**. At the same time check the validity of your consolidation settings on this display.

AFI will now be used to process sales invoices and credit notes to create General Ledger journals, according to your rules and definitions, from the point when your next invoice or credit run takes place.

Should the AFI determine that an extract or update will not be able to complete successfully, then a message is sent to the user giving details of the problem. After correction, the next invoice run will collect all outstanding data.

Library List

A separate “task level” library list has been created within the Sales Order Processing application for the purpose of performing the extract of data from the Invoicing application into AFI, as part of the invoice print run.

As well as containing the necessary Sales Order libraries, this includes the following AFI libraries:

OSLFIF3 AFI Data files

OSLFID3 AFI Printer and Display files

This library list is loaded as part of the invoice print run.
