Chapter 5

Utilities

Drinks Transport Planning Utilities

The Drinks Transport Planning utilities provide company level data set-up and planner authorisation. In addition, housekeeping facilities are provided via copy, history and purge facilities.

Warning: The utilities require exclusive use of the company, and in some instances the whole module; it is therefore recommended that access to the utility options are restricted to specific users.

The company profile and planner profile options are described in Company Profile and Planner Profile Maintenance.

The utilities options can be accessed from the Drinks Transport Planning Utilities menu.

Control Subsystems

10/DTU

Transport requirements are created via a set of background jobs that run in the Drinks Transport Planning subsystem.

The following jobs become active when starting the subsystem:-

- Requirements monitor,
- Creation of requirements,
- Amendment of requirements,
- Creation of pick requirements from sales order requirements,
- Creation of sales order requirements from pick requirements (i.e. via short despatch),
- Cancellation of Orders.

To initiate the background jobs, use the Start Subsystem and Start Background Processors options.

To cancel the background jobs, use the End Subsystem and End Background Processors options.

Load Purge

20/DTU

This option provides the facility for load history details to be purged from the system on a weekly basis. In addition, payment and route period history details may be optionally deleted.

The following history details are targeted for deletion.

- Load headers.
- Load drops.
- Drop orders.
- Order line details.
- Load charge/payment details (optional).
- Route period history details (optional).

Purge Load History Details Screen

 Select the Load Purge option.

Fields:

Company

Enter the transport company for which historic data is to be removed.

Transport Centre

Enter the transport centre for which historic data is to be removed.

Week Number From

Enter the week number from which historic data is to be removed (defaults to 0).

Week Number To

Enter the week number up to which historic data is to be removed (defaults to 0).

Purge Charge History

1 - If historic charge data is to be removed from the system.

0 - If historic charge data is to be retained on the system.

Purge Route/Period Details

1 - If historic route/period data is to be removed from the system.

0 - If historic route/period data is to be retained on the system.

 Press **F8=Update** to save the details to the file.

Global Route Transfer

21/DTU

This option provides the facility for global change of route across multiple loads. All references of a particular route can be replaced with a revised route or optionally a particular drop on a given route can be revised to a new drop on the same route or a new drop on a different route.

Load history details can optionally be targeted for route change, in addition to live data.

The following details are targeted for route change:

- Delivery profiles.
- Carrier routes.
- Load headers.
- Load drops.
- Drop orders.
- Load charges.
- Route history (optional).
- Load history (optional).

Global Route Change Screen

 Select the Global Route Transfer option.

Update load history 1 (0=No, 1=Yes)

This job will update ALL occurrences of the route and drop (including details on history files if selected). It may therefore take a long time to run, and will require exclusive use of Transport Planning. The background processors must be stopped while this job is running.

PLEASE ENSURE THAT YOUR D.P. DEPARTMENT ARE INFORMED

Fields:

Company

Enter the transport company for which the route transfer is to take place.

Transport Centre

Enter the transport centre for which the route transfer is to take place.

Original Route

Enter the existing route code, all occurrences of which are to be replaced by the revised route.

Original Drop

Enter the existing drop, all occurrences of which are to be replaced by the revised drop.

Revised Route

Enter the revised route code to which the original route is to be changed.

 *Note: The revised route must previously have been defined to Drinks Transport Planning.*

Revised Drop

Enter the revised drop to which the original drop is to be changed (only available if, and when, the original drop is entered).

Update Load History

0 - If load history details are to remain unchanged.

1 - If the route code on the load history files is to be amended.

Note: If load history files are to be amended, and a large amount of load history is retained on the system, this could greatly increase the amount of time taken for this procedure to run.

Press **F8=Update** the update the files.

Update Load History

22/DTU

This option provides the facility for the deletion of cancelled loads, and the deletion together with a drop to history of completed loads.

Depending on the configuration of the processing transport centre, loads may be processed complete after any of the following process steps have been completed.

- Printing documentation (loads sheets/bill of lading).
- Confirm despatch.
- Authorisation of payment details.

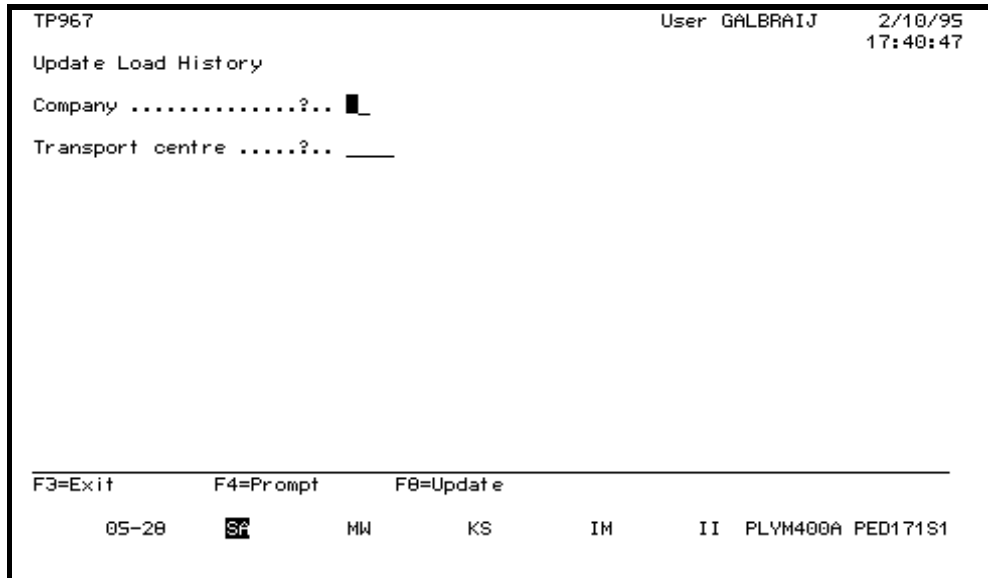

The following information is deleted and history details are created.

- Load headers.
- Load drops.
- Drop orders.
- Order line details.
- Load charge details.
- Load text.

Route period history details are updated for the carrier/vehicle type combination for both completed and cancelled loads.

Update Load History Selection Screen

 Select the Update Load History option.

The screenshot shows a terminal window with the following content:

```
TP967                               User GALBRAIJ    2/10/95

```

Fields:

Company

Enter the transport company for which loads are to be dropped to history.

Transport Centre

Enter the transport centre for which loads are to be dropped to history.

 Press **F8=Update** to update the files.

Remove Audit Transaction Data

24/DTU

All master and transaction file data is audited according to system standards - i.e. record images are written to separate audit files for all record additions, changes and deletions.

- After image (additions).
- Before and after image (changes).
- Before image (deletions).

Although all files are audited, it is likely that those files directly associated with the processing of loads will increase in size relatively quickly.

This facility allows audit files associated with the following load data to be cleared:

- Load headers.
- Load drops.
- Drop orders.
- Order line details.
- Load charge/payment details.

Warning: It is important that required audit information is reported on, via a hard copy, prior to running this option.

Note: Audit deletion is carried out on a date basis with the default date set such that the latest two weeks of audited transactions are retained.

Remove Audit Transaction Data Selection Screen

Select the Remove Audit Transaction option.

TP950	HW - Handy Wholesalers Ltd	User GALBRAIJ	3/10/95 9:37:11
Remove Audit Transaction Data			
Date before which audit details are to be removed... <u>18/09/95</u>			
F3=Exit F8=Submit			
06-55 S* MW KS IM II PLYM400A PED171S1			

Fields:

Audit Removal Date

Enter the date before which audit details are to be removed.

Press **F8=Submit** to submit the audit deletion.

Upon submission of the batch job, audit records created before the entered date are removed and the audit files re-organised.

Serious Error Report

30/DTU

This option provides for the reporting, and optional deletion, of serious errors logged to the error file.

A number of error conditions may occur during the planning processing cycle, and these may require manual intervention in order to process complete, associated loads.

These error conditions are trapped in order to ensure that any data integrity problems found by the background transport requirements / amendment processes are noted.

The error codes, defined in the Inventory Descriptions file, major type 'TPSE', are as follows:

01 - Sales order not found

Sales order passed to Drinks Transport Planning can no longer be found in Sales Order Processing at the point at which transport requirements are created and/or amended.

02 - Pick note header not found

Pick note passed to Drinks Transport Planning can no longer be found in Sales Order Processing at the point at which transport requirements are created and/or amended for the pick note.

03 - Item record not found

Inventory item master record cannot be found at the point at which transport requirements for the item are calculated i.e. weights (gross, net and tare) and volumes.

04 - Item/stockroom record not found

Inventory item/stockroom profile record cannot be found at the point at which transport requirements for the item are calculated i.e. weights (gross, net and tare) and volumes.

05 - Route specified not found

Default route defined to a delivery profile cannot be found at the point at which transport requirements are calculated for an order.

06 - Time out for requirements update

This error condition arises if a time out occurs on the retrieval of a locked sales order record.

It is important that transport requirement creation/amendments are 'single threaded' through the system, i.e. creation of order requirements must be completed prior to the processing of amendment requests (driven for example by sales order amendments or pick note production).

Under these conditions a sales order will be locked for the duration of the requirements creation before an amendment request can be processed.

If the amendment request finds the sales order already locked it will wait and retry the order for a duration of five minutes before issuing a serious error and bypassing the order amendment request.

07 - Details changed after AFI posting

Not currently implemented.

08 - Details changed after manual override

Planned and actual capacities (weights, volumes and numbers of containers) are maintained by the system automatically until a manual override takes place that will maintain actual capacities in isolation, (via Build or Maintain loads order amendment). If a manual override has taken place and a request is made to amend associated order transport requirements (driven for example by order amendments or pick note cancellations in Sales Order Processing), only planned capacities will be amended and a serious error will be issued.

09 - Global route change warning

Issued as part of a global route change request for each carrier/route combination affected.

10 - Possible capacity problems

As part of the conversion of sales order transport requirements to pick note transport requirements (and the reverse process as driven for example by pick note cancellations), it is possible that weight and/or volume capacity errors can arise for vehicle types associated with assigned loads. If this occurs a serious error will be issued.

11 - Item transport profile not found

Transport item profile record cannot be found at the point at which transport requirements for the item are calculated i.e. weights (gross, net and tare) and volumes.

Note: The report details errors logged across all Drinks Transport Planning companies defined to the system.

Serious Error Report Submission Screen

 Select the Serious Error Report option.
