Glossary

Glossary

Access Point

A point of reference in the dimension of key element being defined. For example there is an access point between aisles A and B.

Action List

A list of instructions to perform a number of warehouse moves including picks, putaways and transfers.

Area

That part of a warehouse the definition of which corresponds to the construction of the Location Code. The Area has a two-character code.

Area Dimension

A Location Code is made up of up to four elements. Each element is called an Area Dimension.

Area Rules

See **Rules**.

Check Digits

Check Digits or Return Codes can be used within the application to ensure that warehouse staff have visited the defined location. It is a pair of characters, displayed on the location, which must be entered to confirm an action. Check Digits are user-defined.

Committing

The Sales Order Processing, Invoicing and Production Control applications allocate stock against the four wall inventory for the warehouse. When the picking decisions are made, the inventory at a location is 'committed.'

Committing Sequence

When inventory is committed this can be done by sorting the despatch documents by journey, customer, order or despatch note. This will determine the

quantity to be picked in one pick and may, therefore, determine where it will be picked from.

Like items within the commit sequence will be consolidated to give a single quantity to be presented to the commit process.

Continuous Processing Programs

A number of programs which are run continuously in order to monitor action taken in one part of the application which cause a re-action in another part. Monitoring receipts to the Inventory Management application in order to make put away decisions is a typical example.

Datum Location

The start point or reference location for the execution of an **Area** or **Item Rule** - see **Rules**.

Dimension Code

An **area** is defined by a number of dimensions, for example aisle, level and column. Each value in a dimension is a dimension code, e.g. aisle C.

Fixed Location

Although, most items in a warehouse will be stored 'randomly', it is possible to define a single or a number of nominated locations to house the item.

Hand-held- terminals

Also called PDT's (portable data terminals), a small hand-held device to which a small batch of instructions can be down-loaded from a computer equipped with a Bar Code reader for confirming action.

Instruction Documents

See **Action List**.

Item Profile

Information which defines how the item will be put away, stocked, moved and picked in the warehouse.

Item Rules

See **Rules**.

Label

When a receipt is made the application can be set up to print labels to be affixed to a pack to identify the item, lot number, quantity and dates.

Labels can be assigned to a unique reference such that each pack is assigned a unique label.

Location Type

Locations may be classified so that fit calculations may be performed.

Lot Numbers

An item may be defined as being controlled as a lot number.

Marshalling

A nominated location, normally set up solely for this purpose, which contains all items where pick has been confirmed, but despatch has not yet taken place. This is a special location not subject to the constraints of standard locations.

Minimise Lots

When the application decides which locations are to be used to pick from, if the item is lot controlled, this application can be made to consume all of the first selected lot, wherever it is in the warehouse, before selecting the next lot.

Modulus 23

A method of generating **Check Digits** from a number by dividing it by 23 and using the remainder to select a letter from the alphabet, (omitting OV and I).

Movement Programming

The method by which the locations to be tested are established in an **Item Rule** - see **Rules**.

Pack Types of Package Types

Items may be moved in standard outer packs such as pallets, tatepans, bundles etc. These can be defined to the application.

Pick Location

A fixed location for a normally fast moving item from which the majority of picking takes place. Replenishment of this location can be automatically managed by the application.

Proximity Rule

A particular type of **Area Rule** - see **Rules**.

Random Rule

A particular type of **Area Rule** - see **Rules**.

RDT's

Radio Data Terminals. These are either hand-held or truck mounted and allow continuous contact between an operator and the application. This means that real-time processing is possible.

Reason Code

When a non-standard action is taken a reason must be given. It may be selected from a displayed list of Reason Codes.

Receiving

A nominated location, normally set up solely for this purpose, which contains all items received into Inventory and recommended for put-away, but confirm put-away has not yet taken place. This is a special location not subject to the constraints of standard locations.

Replacement or Replenishment Quantity

The quantity to be found and placed in the **picking location** to refill it.

Resources

Whenever a movement takes place in a warehouse it is achieved using some kind of agent or resource. These can be defined.

Rotation Date

Stock may be rotated using the expiry date, the date of receipt to the warehouse or to the location.

Rules

When a recommendation is made by the application to put away into or pick from a location the decision is based upon one of a number of rules.

There are **item rules** and **area rules**. An item rule moves from a nominated location in a pre-defined pattern to test the neighbouring locations, while an area rule tests all the locations in an area or a defined part of an **area**, in a specified sequence. The sequences may be random, how close the location is to a defined search anchor point, or the frequency of use of locations.

Serious Error Monitoring

When the application detects a non-standard action it logs the event. It can also direct a message to a nominated user or panel so that instant action may be taken by the supervisory function.

SKUs

Stock Keeping Unit or the unit of measure in which the item is accounted for and actioned in the warehouse.

Split Packs

If the item is stored in units of less than a complete pack, then separate rules can be set up to control this condition.
