

Function Brief

Date: November 2000 Version: 3.5.2 SP4 Number: 331 Issue: 1.0

Manufacturing: Catchweight In Production Warehousing

Summary

Catchweight processing has been introduced into the Warehouse Issue task (10/WHP).

If Catchweight is active then any issues of Catchweight items from Warehousing now calculates the secondary value. If the Catchweight Type indicator on the item master is 1 or 2, then a new screen allows the secondary value to be overwritten, before the issue takes place.

Key Points

- The menu option Confirm Issue for Production (10/WHP) has been changed to calculate secondary values on Catchweight items.
- Warehouse issues through the Production Booking menu options also calculate Catchweight details when necessary.
- No database changes have been made.

Functional Detail

Confirm Issue For Production (10/WHP)

Catchweight processing has been incorporated into this task. If Catchweight is active, on the Inventory company profile, and any of the inputs being formally issued (that is issues that are not backflush or floorstock items) are Catchweight items as specified on the item master, then the issue quantity is now calculated in the secondary unit of measure. If any item is defined as being of Catchweight type 1 or 2, then a new screen is displayed:

Manufacturing: Catchweight In Production Warehousing

PD171	V3.5.2	Company	USER xxxxxxxx
31/03/00		Warehouse	
14:58:30			
Confirm Issue			
Secondary Values for Pick Reference ...		W000001	
Ln.	Item	Description	Quantity
Ovr	Lot	Rotation Date	Secondary Value
1	ITEM1	Item 1 description	2.000 KG
		0/00/00	<u>10.0000</u> <u>OZ</u> 2
F4=Prompt F8=Update F12=Previous			

All the issue details for Catchweight items, type 1 and 2 are displayed, along with the secondary value and associated unit of measure, which may be overridden:

Secondary Value:	Mandatory. Override this value with the correct issue value for the secondary unit of measure.
Unit of Measure:	Mandatory. Override this code if the secondary value entered above is in a different unit of measure. Select F4=Prompt to view the available units of measure.

Select **F8=Update** to process the issues, or **F12=Previous** to return to the main issue panel.

The following updates are done for when Catchweight items are formally issued:

- The Component Usage record (PCP02) is updated with the secondary value and unit of measure for Catchweight items. This is then used held in the stock movement details of Inventory.

Bookings

When warehoused inputs are issued through the booking programs, because they are backflushed or floorstock items, the system checks to see if they are defined as Catchweight items. If they are, the secondary value and unit of measure is calculated. An existing panel is output for Catchweight items of type 1 or 2 to allow the secondary value and unit of measure to be overridden. These details are then put onto the Component Usage record (PCP02)

End User Changes

Confirm Issue For Production (10/WHP)

If Catchweight items are processed in the Confirm Issue For Production task (10/WHP), a new screen is displayed for Catchweight items of type 1 or 2 to allow the secondary value and unit of measure to be overridden.

If Catchweight items are issued through the booking programs, a screen is displayed for Catchweight items of type 1 or 2, to allow the secondary value and unit of measure to be overridden
