

Function Brief

Date: January 2000 Version: 3.5.2 SP3 Number: 371 Issue: 1.0

Catchweight Processing – Sundry Enhancements

Summary

There are two minor enhancements to the Catchweight processing function in this release. You can now:

- Suppress the capture of secondary stock balances during some Inventory transactions.
- Recalculate the secondary stock balance for Catchweight type 3 items.

Key Points

None.

Functional Detail

Suppress Capture Of Secondary Balances

There is now no need to capture the actual secondary balance during the following transactions because there is no physical movement of stock:

- Record Purchase Order.
- Adjust Allocated Stock.
- Adjust Frozen Stock.

The movement balance and value are calculated from the nominal secondary balance instead.

Recalculate Nominal Secondary Balance Utility

This now includes Catchweight type 3 items. Inventory calculates the secondary stock balance from the primary stock balance for the stockroom, lot, FIFO/lot trace and location balances within Inventory.

Warning: This option does not produce stock movements or an audit trial.

This option was introduced so that you can convert an existing item to an item with a secondary UoM and balance, but no Catchweight item type. The cost UoM of such items is the stockroom issue UoM, so recalculating their secondary balance has no cost or stock value implications. The cost UoM of Catchweight type 3 items is their secondary UoM, so recalculating their secondary balance will change the item's stock value when a discrepancy is found.

Tip: If you hold a lot of Catchweight type 3 items, then JBA recommend that you run a stock valuation before and after running this option.
