Chapter 3

Enquiries

Configurator Enquiries

The configure-to-order environment relies on efficient communication between the sales and production sections of the company and also on the accurate traceability of specific configurations of a product within the system.

The enquiries display configurations and orders affected by configuration.

Order Status Enquiries

These provide a link from the sales order line to any connected supply orders, including any production orders linked through configuration or make-to-order processing.

Production Order Enquiry

This provides a link into line enquiries for any connected sales orders. Select **F17** to display the sales order 'Reservations Enquiry' window.

Inventory Lot Trace Enquiry

Each configured product, or batch of product, must have a unique identifier, i.e. the batch, lot or serial number which is assigned at finished goods receipt time and which will be physically attached to the product (stamped, labelled etc.).

By using this reference number, the Inventory Management Lot Traceability Enquiry provides a full history of the product including all inputs issued to the production order together with the finished goods receipt(s) and all customer order issues and returns.

There are three particular types of enquiry which are relevant to a configuration environment, i.e.

- The status of a particular order
- The traceability of a particular configuration throughout the processing cycle
- Details of what is contained within a particular configured product

Route Enquiry

This displays operations and inputs, and you can toggle between the Production operation sequence and the Configurator presentation sequence.

Route / Input Enquiry

Press **Enter** from the standard enquiry to display a window of additional Configurator options.
