## Chapter 5

### Utilities

# Operation Mass Replace

Select Operation Mass Replace.

You use this option to ensure that changes made to operations on the model configuration route are reflected in all related base items.

## Fields:

### Model item

Enter the model item. The Inventory item prompt is available.

### Operation Code

Enter the code of the operation on the configuration route for the model item. A prompt is available on operation codes defined in Inventory Descriptions Maintenance.

Enter valid details and then press **Enter**. Then select F8 to submit the job for batch processing. If required, you can reselect the details.

# Configurator Background Processing

Configurator uses background processing jobs for the following tasks:

- The update of production order details for configured and make-to-order lines.
- The allocation of finished goods on production orders to any connected sales order lines, including configured lines.

The Configurator utilities provide a method of controlling the operation of these background processing jobs and the subsystems in which they run.

The following background subsystems are used by Configurator:

- PCBACK3 – production order updates
- INBACK3 – allocations to sales order lines

These subsystems must be started before any order processing takes place on the system for configured or make to-order products.

## Start Production Order Creation

This starts the background job in subsystem PCBACK3 which updates production orders for configured and make-to-order lines.

*Note: This job must be active whenever sales orders requiring configured or make-to-order lines are entered or amended.*

## End Production Order Creation

This ends the subsystem PCBACK3 and all jobs running in it.

*Note: This option should not be invoked if any order processing is taking place on the system for configured or make-to-order products.*

## Start Reservation Monitor

This starts the background job in subsystem INBACK3 which allocates finished goods to corresponding configured, make-to-order and purchase-to-order lines.

*Note: This job must be active whenever finished goods are received into Inventory from supply orders connected to sales order lines, including configured lines.*

## End Reservation Monitor

This ends the subsystem INBACK3 and all jobs running in it.

*Note: This option should not be invoked if any order processing is taking place on the system for configured, make-to-order or purchase-to-order products.*
