Chapter 11

Background Processing

Start And End Stock Monitor

1/INB & 2/INB

***Warning: You must start the subsystem
INBACK3 in library OSLINP3 first.***

These options start and stop the Stock Monitor. This monitor checks for any lot details where the expiry date has been exceeded, in this case monitor freezes the lot.

The stock monitor is a background job that establishes the stock status from the production, expiry and availability times and dates on the lot header details, and updates the frozen and available stock balances, as appropriate, on a daily basis.

The procedure starts directly from the menu using the option Start Stock Monitor and ended in a similar way using the option End Stock Monitor.

If the stock monitor is already running when you attempt to restart it, the application will display a window indicating when the monitor started, and who started it, press **Enter** to continue.

Start And End Reservation Monitor

3/INB & 4/INB

***Warning: You must start the subsystem
INBACK3 in library OSLINP3 first.***

These options start and stop the Stock Reservation Monitor. This monitor performs the updates of the sales orders when you have made a back to back (or direct delivery) purchase receipt.

This option is only valid when you have installed the Advanced Order Entry and Purchase Management applications. If no stock is available for an order, the Advanced Order Entry can automatically raise a purchase order. Through Advanced Order Entry you can reserve against this outstanding purchase order. If the reservation monitor is running, when you receive the goods, the job automatically identifies them as reserved against a sales order and allocates the goods to the appropriate sales order.

This procedure submits directly from the menu, using the option Start Reservation Monitor. It stops directly from the menu using the option End Reservation Monitor.

If the Reservation Monitor is already running when you attempt to restart it, the application will display a window indicating when the monitor started, and who started it, press **Enter** to continue.

Start And End Pricing Monitor

5/INB & 6/INB

These options start and stop the Advanced Pricing Monitor. When you specify background pricing for the company this routine performs the relevant calculations and updates.

Start And End Invoice Refresh Monitor

7/INB & 8/INB

These options start and stop the Invoice Refresh Monitor. When selected, this routine performs the updates to the Invoice Monitor.

This option refreshes the database of invoice references with the generated references at the time of invoice print. The procedure submits straight from the menu using the option Start Invoice Refresh Monitor. The procedure stops using the stop Invoice Refresh Monitor option.

Start And End Restrictions Monitor

9/INB & 10/INB

When you add and edit price types, you can add and edit restrictions associated with them. These restrictions can be special prices and discounts. You can apply restrictions when adding and editing price types, or as a background process later.

For more information see the Sales Details option in Customer Maintenance.

To apply the restrictions as a background process, you start and stop the restrictions monitor. To do this, select the Start Restrictions Monitor and Stop Start Restrictions Monitor options. In each case, Inventory displays a window for confirmation.
