Glossary

Glossary

Accruals

Goods received, but not yet matched against a supplier's invoice.

Advice Note

A document received from the supplier detailing goods delivered, and/or promise dates for goods to be received in the future.

Blanket Order

A type of scheduled order, with the commitment to quantities and dates being only provisional. It is processed in the same way as a scheduled order within Purchase Management.

Booking in Point

Goods received in Purchase Management can be brought in to any one of three locations; goods inwards, inspection or stores.

If receipt into stores is specified, stock balances in Inventory Management are updated. If you receive goods into goods inwards or inspection, they must be transferred to stores before these updates will occur.

Centralised Purchasing Support

This enables a single order to be raised for the total company requirements, allowing the buyer to negotiate the best terms based on the volume. The receiving stockroom is maintained on the purchase order line. Purchase order prints have a page break on change of stockroom and print the stockroom's delivery address. Goods receiving is by stockroom and GRNs and labels can be printed on local printers. All reports display the order line stockroom.

Confirm Flag

A user defined code to describe the current status of a purchase order line, e.g. C- confirmed, D - delayed, Q - queried. It is not validated and is used for selection purposes.

Confirmed Order

An order that has been entered on the system, but has not yet been released by running out the New Orders report. Such an order can not have receipts entered against it until it has been released.

Company Profile

A defaults and configuration file for each Purchase Management company.

Cost Code

A General Ledger account to which the goods value is posted in invoice matching. For stock items, a default cost code is set up in Inventory Management. For non stock orders, a code must be entered when the order is entered.

Delivery Instructions

A set of text with information regarding delivery of goods, which may be selected for printing on the purchase order.

Department

The department within the company which is responsible for the purchase order.

Dissection

The breakdown of a single transaction value across a number of General Ledger accounts or VAT codes

Exception Reports

These reports (item supplier profile and order file exception reports) include discrepancies within the database which may need actions to rectify.

Expected Date

The date that the goods will realistically be expected to be delivered. Defaults to the requested date if not specified.

G/L Acct

A General Ledger account to which the goods value is posted in invoice matching. For stock items, a default cost code is set up in Inventory Management. For non stock orders, a code must be entered when the order is entered.

Goods Receipt Note

A document produced within the application which provides details of the goods received within the current session.

Group Unit of Measure Code (GUMC)

The group unit of measure code is a parameter type which allows you to convert between one unit of measure and another, and also to separate from each other units which are not comparable. Each unit of measure code (UOMC) can be associated with a group unit of measure code. These are used when raising non stock orders and are maintained via Miscellaneous Codes Maintenance.

IN Currency

A European currency that is linked to the EURO currency with a fixed exchange rate.

Internal Trace

This is the batch/lot/serial number which can be applied to receipts at goods receiving.

Invoice Match

The matching of an invoice from a supplier against goods previously delivered.

Inspection Required

Items flagged as requiring inspection in Inventory Management are checked at receiving to help to ensure that they pass through inspection.

Item

The purchased item represented by a unique code.

Item/Supplier Profile

The item supplier profile is used by the Purchase Management application to provide details of supply of an item from a specific supplier.

Job Number

A user-defined code which may be associated with a whole order or order line.

Label

Details of goods received may be printed automatically on labels within Purchase Management. The label may then be attached to the goods for future identification.

Landed Cost

Additional purchasing costs incurred above the line price of items may be recorded against purchase transactions.

Line Order

A non-scheduled order, i.e. a single delivery is expected for each order line.

Multi Currency

A Purchase Management company becomes multi-currency by being linked to a multi-currency Accounts Payable company. This means that Purchase Management suppliers can trade in any currency available to the General Ledger company.

Nominal Code

A General Ledger account to which the goods value is posted in invoice matching. For stock items, a default cost code is set up in Inventory Management. For non stock orders, a code must be entered when the order is entered.

Non stock Order

An order with an order class of 5 to 8, containing non–stocked items or services that do not require item tracking.

Order Class

Specifies if the order is stocked, non-stocked or a service order.

1–4 represent stock orders.

5–8 represent non-stock orders

(where 6 is a service order).

Parameters and Miscellaneous Codes

These are used to describe and validate the various codes used within the Purchase Management application, for example unit of measure and scrap codes. These are in addition to the codes set up in the descriptions file of Inventory Management.

Price Variance

This represents a difference in the price of goods between expected and actual. The normal comparisons are:

Standard to Order

Standard to Invoice

Order to Invoice

Promise Date

The date of delivery for the goods, as promised by the supplier.

Purchasing Officer

A person responsible for purchasing. Individual purchasing officers may be recorded against each purchase order.

Receiving Address

A set of addresses may be maintained which represent all possible receiving sites/locations within the company. These are selected when processing an order.

Rejection Note

These notes may be printed when returns, scrap or adjustments are recorded against a receipt.

Request Date

The date on which the goods are requested for delivery.

Requisition

A request for the supply of an item.

Returns

Goods to be shipped back to the supplier, when damaged, over delivered, or of an incorrect specification.

Released Order

An order that has been entered on the system and has been released by running out the New Orders report. Because it has been released, the order can have receipts entered against it.

Scheduled Order

A firm commitment with a supplier for quantities of goods to be delivered on specific dates. Multiple deliveries are expected for each line.

Schedule Type

Designates the type of order:

S - Scheduled order.

B - Blanket order.

Blank - Line order.

Scrap Reason Code

Defines the reason for returning goods to a supplier, or scrapping goods against an order.

Service Order

Service orders are defined with order class 6. For these orders it is not necessary to release or receive the order and it is possible to match invoices to these orders once they have been entered.

Shipping Code

The reference given by the supplier to the shipment satisfying the purchase order.

Stock Order

An order that contains goods for which an item code has been defined in Inventory Management. The order class is 1 - 4.

Stockroom

The store or warehouse at which purchased goods are to be received.
Stockroom defaults can be set up for the Purchase Management application.

Supplier Code

A code representing the supplier, which must be set up in the Supplier Master File of the Accounts Payable application.

Supplier Item Reference

The supplier's catalogue code/item code for an item.

Unit Of Measure Code (UOMC)

This parameter type gives the various units of measure required for purchasing and receiving of non-stock items. Each unit of measure may be associated with a parameter detail from the parameter type Group Unit of Measure Code (GUMC).

User Authority

Values assigned to users in order to control the confirmation of both under and over delivery of goods and invoice pricing. This is used in Goods Receiving and Invoice Matching.
