Chapter 5

Application Interface

Send Orders

1/PMIAI

Select Send Orders to display the Send Orders screen.

The application interface is designed to extract purchase orders from the Purchase Management module and send them by Electronic Data Interchange (EDI) to the supplier.

The purchase orders to be extracted are determined by the Purchase Orders Audit function in Purchase Management, which validates the supplier against the trading partners maintained in this module. If the partner is to be sent purchase orders and the document is active, the audit function will flag the order to be sent via EDI. The EDI Purchase Orders may be added into the EDI/400 Mailbox send queue.

A control list may be printed, displaying all orders sent via this run.

The standard Purchase Order Print function may also be selected. This will print all purchase orders waiting to be sent to the supplier, except for those which are defined in this module as active and in production.

Note: This option may replace the standard Purchase Order print function or be used in parallel.

Note: Purchase order amendments are also automatically extracted along with new purchase orders, but are 'flagged' as amendments in the Application Interface database

This screen allows the options to be selected prior to invoking the batch function which extracts purchase orders to be sent via EDI and/or printed.

PMI010	Z1 - GB Demonstration Company	User GBJBANB1	4/06/98 09:08:34
Send Orders			
Add orders directly into mailbox queue <u>1</u> (0=No,1=Yes)			
Print EDI orders control list <u>1</u> (0=No,1=Yes)			
Print orders immediately <u>1</u> (0=No,1=Yes)			
F3=Exit F8=Submit			
MA	a	06/058	

Fields:

Add Orders Directly Into Mailbox Queue

You can enter the following:

- 0 - No. Holds the extracted purchase orders in the Application Interface database.
- 1 - Yes. Extracts and adds the purchase orders into the EDI Mailbox send queue as a translated document.

Print EDI Orders Control List

You can enter the following:

- 0 - No. Suppresses printing of the Control List.
- 1 - Yes. Prints a Control List showing details of all purchase orders extracted in the run which are to be sent via EDI.

Print Orders Immediately

You can enter the following:

- 0 - No. Processes only paperless EDI purchase orders.
- 1 - Yes. Invokes the standard purchase order print function.

Press **F8=Submit** to submit the batch function.

This performs the following functions:

1. Selects only purchase orders which have been flagged to be sent via EDI (by the New Orders Audit in Purchase Management).
2. Creates a supplier header record (in the Application Interface database) for each Supplier.
3. Creates an order header record for each order, flagging amended orders to differentiate from new orders.
4. Creates delivery instruction records where found.
5. Creates purchase order line records for each order line.
6. Once all order lines are processed, an order trailer record is created and all the order details are output to the control list (if required).
7. A supplier trailer record is created once all orders for the supplier have been processed.
8. Once all EDI orders have been extracted and written to the Application Interface database, an EDI Interface function can be invoked. This picks up these records, translates them into the appropriate message standard and adds the orders into the Mailbox Send queue in the EDI module. When records have been added to the mailbox they are removed from the AI interface files.
9. If selected, the standard purchase order Print function is invoked which selects all new purchase orders to be printed, excluding only those defined as active and in production via the Trading Partners Maintenance option.

Receive Acknowledgements/Despatch Advices

11/PMAI

Select Receive Acknowledgements/Despatch Advices to display the Receive EDI Acknowledgements/Despatch Advices screen.

Order Acknowledgements update the promised delivery date, and Despatch Advices the shipment date, on the appropriate purchase order lines.

The purpose of this function is to receive order acknowledgements and despatch advices sent via EDI by suppliers. These documents are matched to the corresponding purchase orders and may update the promise date and shipment date respectively on the order line or schedule line.

Acknowledgements and despatch advices may be received separately. A control list is available to provide an audit of all acknowledgement/despatch lines received, or of only those in error.

Note: The acknowledgements and despatch advices must have already been received in to the Application Interface Database via the 'Receive Documents' function in EDI.

This screen allows you to select options prior to running the batch function which updates purchase orders based on acknowledgements and/or despatch advices received via EDI.

PMI530	Z1 - GB Demonstration Company	User GBJBANB1	4/06/98 09:26:49
Receive EDI Acknowledgements/Despatch Advices			
Document inclusion 3 (1=Ackn only,2=Advices only,3=Both)			
Control list inclusion 1 (1=All orders,2=Exceptions only)			
Update order dates 1 (0=No,1=Yes)			
F3=Exit F8=Confirm			
MAI	a	09/045	

Fields:

Document Inclusion

You can enter the following:

- 1 - Ackn Only. Process acknowledgements only.
- 2 - Advices Only. Process despatch advices only.
- 3 - Both. Process both.

Control List Inclusion

You can enter the following:

- 1 - All Orders. Prints all order acknowledgements and/or despatch advices received.
- 2 - Exceptions Only. Prints only those orders in error.

Update Order Dates

You can enter the following:

- 0 - No. Not to update, i.e. only print the details on the control list.
- 1 - Yes. To update the dates on the purchase order lines.

Press **F8=Confirm** to submit the batch function.

This performs the following functions:

- 1. If a customer order reference is found, it checks that this is a valid order number in Purchase Management. If it is invalid the acknowledgement or despatch advice is ignored and output on the control list.

All document lines are processed as follows:

- 2. The promised date on the acknowledgement must not be in the past or the shipment date on the despatch advice in the future. In such cases, the document line is ignored and output on the control list.
- 3. The item and required date are used to find the corresponding purchase order line (including schedule lines). If no match is found the line is ignored and output on the control list.
- 4. If the document line quantity differs from that outstanding on the purchase order line, the document line will be ignored and output on the control list.
- 5. If you select update the acknowledgement date is used to update the promise and due dates. Similarly, the despatch advice date updates the shipment and due dates.
- 6. If the control list inclusion has been set to 'all', the lines are always output to the control list.
