Glossary

Glossary

Account Code

The unique code given to every account, consisting of one to four levels of a maximum twelve characters, as defined by the account's ledger, and used for all fiscal transactions.

The term given to the first twelve characters of the account and the last thirty characters of the extension code together.

Accounts Receivable Interface Postings

If your bank sends you details of your Accounts Receivable receipts on magnetic tape or electronically then the Interface Posting facility will automatically post and allocate.

Application Interface

A System 21 application which extracts documents to be sent to a Trading Partner via EDI and adds them into EDI/400 for translation and transmission.

Conversely, it updates System 21 with information from documents received via EDI/400.

ANSI X.12

A message standard developed by the American National Standards Institute. Widely used in the United States.

Application Menus

A menu is a panel listing functions available in a particular area of the application. You can tailor menus to your specific requirements.

Application Reference Data

This is the basic data set up by the user without which the application cannot function – payment methods, for example, or extended terms.

Audit Trail

It is vital that a complete record of all data entries and amendments be kept in order to comply with accounting regulations and to provide a means of tracking the provenance of any errors.

BACS

Banks' Automatic Clearing System; a procedure whereby payments may be made to suppliers electronically through the banks' computer systems.

Bank Account

An account on your chart of accounts which has been defined as a bank account to which transactions will be posted.

Bank Reference

When a bank receives a session of collection documents, it sends an acknowledgement back, listing the documents received. The bank reference is the reference number on this acknowledgement.

Base Currency

If your company uses more than one currency, a *base* currency must be specified for it. This is the currency into which any non-base ('prime') currency will be converted for the purposes of enquiry, reporting and accounting. Once postings have been made to the company the base currency cannot be changed, so it must be decided with care.

Batch Control

The company profile can be set up to allow transactions to be posted in batches for control purposes. Accumulated batch values are then validated against a given batch total. Unlike **Session Control**, this function is optional.

Bill of Exchange

See **Collection Document**.

Cash Apportionment

If you need to spread cash received by collection document over different bank accounts and in certain proportions, setting up a cash apportionment table within Cash Management enables you to achieve this.

Caution Days

The receipt of cash from a collection document cannot be guaranteed until confirmation, some days after the maturity date. This number of days can be specified on the system as caution days.

Chase Letter

See **Dunning Letter**.

Cheque Sequencing

The system enables you to issue cheques in batches and to keep track of any last or spoiled cheques.

Collection Document

A collection document or bill of exchange is a guaranteed negotiable payment which may be issued *to* the company by its customers, or *by* the company to its suppliers as a promissory payment of an outstanding debt. When a collection document is accepted or issued, it is posted to the company's account to reduce the outstanding debt. On maturing, the document is exchanged for cash – as a payment or a receipt.

Company Profile

Cash Management is a multiple company application and a number of parameters for each of its companies must be set up before the application can be run. The company profile contains all the basic rules within which a particular company is to operate.

Contra Accounting

A trading partner may often be both a supplier and a customer. Where this is the case, the contra accounts facility establishes a link between the supplier and customer accounts. This link causes an Accounts Payable payment to be reduced by the amount in the contra account in Accounts Receivable.

Control Account

A control account holds values posted from all the accounts of a sub-ledger beneath it. Postings cannot be made directly into a control account.

Control List

A System 21 Application Interface report providing details of Documents to be sent or received via EDI.

Country Code

Depending on where it is used, the country code may either control which options are available to users, or it may simply control the format of the bank account window to appear when entering bank details.

Currency Code

If you are running Cash Management in a multi-currency environment, a transaction can be entered in base currency, or in any other currency defined to the system. The three-character currency code refers to the currency to be used, and provides default exchange rates, etc.

Currency rate code

For multi-currency Cash Management you can define default rate codes to be used to convert prime currencies into base.

Default

A default value is a value stored by the system for use when no other value can be found. For example, when setting up extension codes for an account, you have the option to specify default codes which will appear in the extension code window whenever the account is entered.

Direct debit

Direct debits can be created within Cash Management. The difference between a direct debit and a collection document created automatically is in the way they consolidate payments:

Automatic creation will either create separate documents for each invoice due date, or separate documents for each invoice, depending on a setting in the customer master file.

Direct debit creation creates a debit for all invoices up to the specified due date.

Discount Codes

If you wish to benefit fully from any early settlement discounts offered by a supplier, or if you wish to offer such discounts to a customer, you can define the

schedule of settlements to a discount code, which will alert you to available discounts.

Dissection

The break-down of a single transaction value across a number of General Ledger accounts or to VAT codes.

Due Date

The date on which payment of a transaction is due.

Dunning Letter

A letter sent to inform a debtor of the status of the account. Formerly known as a *chase letter*.

EDI

Electronic Data Interchange. A method of transmitting business information over a Network, between Trading Partners who agree to follow approved national or industry standards in translating and exchanging information.

EDI/400

A PREMENOS module which receives standard Documents from a Network, translates them and adds them into the System 21 Application Interface database.

Conversely, it translates Documents output from the Application Interface into standard Documents. It then sends the Documents to a private or third party network.

Effectivity

It is often useful to be able to define the validity dates of an entity, so that the system can prevent its use outside of these dates. This period of validity is called an entity's *effectivity*.

Exchange Rate

The number of units of one currency which may be bought or sold for one unit (or, in many cases, 100 units) of another currency.

Exchange Rate Code

The code set up to define the exchange rate between two currencies.

Extended Terms

If payment of an item is to be spread over a period of time – paying different amounts each month, for example – then the best way to achieve this is to set up an extended terms code within the Cash Management application, and to define the payment terms to the code.

External Bank Account

You can maintain a record of customers' and suppliers' bank account details.

Flag

A trigger to activate or deactivate certain facilities and parameters within the application.

Held Document

Review codes can be set up to prevent a document being sent to bank. A document with such a review code is a held document.

Historical Data

Application data which has been archived (i.e. is no longer considered current data), but which is retained (usually on tape), and may be restored for enquiries and reports.

Inter-company Accounting

When posting transactions to another company, you merely have to specify that company's code and process the transaction in the normal way.

Interest & Commission

The Cash Management application enables you to record the interest and/or commission your bank will be charging you for services.

Item

In the Cash Management application, an item is a transaction document which has been entered onto the system.

Ledger

A ledger is a collection of accounting records made up by double-entry bookkeeping. It is divided into ledger accounts each of which records transactions of a particular type.

Lockbox

Receive notification from your bank that cash has been paid into your account. Payment advice and remittance information (Tradacoms document type ANSI 823) is processed, validated and received from your bank via EDI.

Lockbox (non EDI) operates in the Cash Management module as the AR Interface Posting option to process valid receipts from your bank on magnetic tape.

Mailbox

An area on an EDI network services computer that holds a customer's transactions. It also allows the customer to send to multiple receivers in a single session.

Mailbox Queue

The component of EDI/400 that combines outgoing transactions and receives incoming transactions.

Mapping

Shows the relationship between Segments and Elements in a standard document and fields in the System 21 Application Interface database.

Maturity Date

The date on which a collection document can be cashed at its full face value.

Menu

See Application Menu.

Miscellaneous Creditor

A supplier who is not paid through the Accounts Payable application but by a separate payment procedure in either the Cash Management or the General Ledger application.

Multi-company

Cash Management is designed to control more than one independent company or several companies reporting to a controlling or reporting company.

Multi-currency

Trading in several currencies, linked to a single currency or multi-currency General Ledger.

Open Item

An open or outstanding item is an item which has been authorised but not yet fully paid.

Outstanding Item

See **Open item**

Parameter

A characteristic or constant factor defined by you or already in the system, which determines the specific form or specific limitations of a function.

Payment Class

All documents of a specified payment class will be included in a session. This means that documents with different payment methods can be included in the same session – different types of collection document, for example.

Payment Method

The way in which a supplier is paid – for example, by collection document, or by BACS. Payment methods are user-defined within the Cash Management application. A three-character code refers to a definition of payment method, which may be cheque, collection document, by electronic means, etc.

Payment Terms

Payment terms define the way in which the payment due date is calculated for each document on the system. The definitions can be very flexible, incorporating repeated payments using *extended terms* if required.

Period

The units into which a financial year is divided for accounting purposes (usually 12 or 13). These are the same for each financial application linked to the General Ledger.

Period Close / Open

The procedure which completes the processing for the current period. The next period may then be opened.

Prime Currency

The prime or *transaction* currency is the currency in which a transaction is made, as opposed to the **Base Currency**, into which prime values will be converted.

Prompt

A facility which brings up a list of records relating to a data entry field. To activate, enter '?' and then press **F4**.

Rate Code

See **Exchange Rate Code**

Reason Code

A code used to define the reason for writing off a document, making a statement posting, etc.

Review Code

A two-character, user-defined code which recommends that a collection document be reviewed. Different codes may indicate different reasons for reviewing a document.

Codes can be defined as 'holding' codes, which will prevent a document from being sent to bank.

Roll Keys

Keys used for the purpose of viewing the next 'page' of details.

Also **Roll Up** and **Roll Down**.

Session

Within the collection document module in Cash Management, a session is a series of collection documents grouped together to be sent to the bank.

Session control

When starting to enter transactions, the system automatically sets up a session number. All transactions entered at once will then be part of that session. The session is the principal method of control in transaction processing, and provides the information required to satisfy audit requirements.

Spread Elements

These are the elements which make up a complete **Extended Terms** definition.

Statement Reconciliation

The process of matching system transactions with items on your bank statement can be dealt with in two ways by the Cash Management application. You can either select items for matching manually, or, if you receive your bank statement on a magnetic medium, you can use the 'Automatic Bank Reconciliation' menu to do the reconciliation for you.

Supplier code

The unique identifier assigned to each of the company's suppliers. Each supplier may have multiple 'delivery addresses'.

Third Party Document

A document whereby a customer settles a debt by passing on a third party's collection document (mainly used in Italy). See also Collection Documents.

Tradacoms

A message standard developed and supported in the UK by the ANA.

Trading Partner

A Customer or Supplier with whom there is an agreement to exchange documents electronically.

Transaction

A general term used to describe a unit of financial data submitted to the application – such as an invoice.

Transaction Currency

Same as **Prime Currency**

Transaction Matching

A procedure by which you can allocate corresponding debit and credit transactions on an account to one another. Matched transactions are then 'invisible' for enquiries and reports.

Transaction Type

- a) The code defining a posting as a certain type of item – e.g. the transaction type 'IN' means an invoice.
- b) A code maintained within Cash Management, used to match items in automatic bank reconciliation.

Utilities

A set of procedures for verification, utilisation and management of the application database. They are not required during normal operation, and when used may require technical support.
