Chapter 7

Italian Function

Italian Function Overview

These functions are developed specifically for Italy:

Portfolio Enhancements (Third Party Tracking)

If a customer settles a debt by passing on a third party's collection document, then the debt is cleared from the customer's account, but must be collected from the third party.

These options enable you to define the third party and its account details when manually creating a document.

Value Dates

Normally, when cash receipts and payments have been created, the Cash Management and General Ledger bank balance is updated, and the customer or supplier debt downdated. Bank reconciliation then clears the transactions.

This function projects the bank balance based on when receipts and payments are expected to clear the bank account. This date is the 'value date'.

Third Parties

1/CSZ

If a customer settles a debt by passing on a third party's collection document, then the debt is cleared from the customer's account, but must be collected from the third party.

This option enables you to create or maintain a third party customer.

Select the Third Parties option to see the following:

Fields:

Name

Enter the customer name.

Address

Enter the address. The first line is mandatory.

Country

Enter the customer's country. This field is mandatory.

Count

This field is for output only, and is a performance indicator which shows how many documents have been accepted or recalled (unpaid but not through the third party's fault) for this third party.

Error

This field shows the number of documents which have been unpaid for this third party, and enables you to reduce the count shown on the third party documents report. This value cannot be greater than the count field.

Active?

0 - Documents from this third party cannot be accepted in payment of an invoice.

1 - Documents from this third party can be accepted in payment of an invoice.

Press **Enter** to update.

Functions:

F11

Delete a third party.

You cannot delete a third party which is already attached to a document.

Value Dates Table Maintenance

The date on which a payment is cleared by a bank is often a number of days later than the document date. A cheque, for example, may be cleared three days after it is written.

If you wish to update your records on an estimated clearing date rather than on the document date, you can enter the number of days' difference in a value date table.

The value date table enables you to enter this number of days based on all of the following:

- Payment method
- Bank account
- Ledger (Accounts Payable, Accounts Receivable and Cash Management)
- Location (i.e. in place / out of place / international)

Select the Value Dates Table option. Enter the payment method and bank account for which you want to define the value dates, and press **Enter**:

Fields:

Days Basis

1 - The value date calculation is based on working days as defined in the General Ledger calendar, which takes weekends etc. into account.

2 - The value date calculation is based on calendar days, ignoring weekends etc.

In Place

Enter the number of days for the value date of a local payment (typically, one within the same city).

Out Of Place

Enter the number of days for the value date of a wider area payment.

International

Enter the number of days for the value date of an international payment.

Note: The number of days in the three items above is the number of days from the document date to the bank clearance day.

Third Party Report

31/CSZ

This option lists all third parties and details for the company in question. Details are laid out as for the maintenance screen.

Value Dates Table Report

32/CSZ

This option enables you to print all value dates for the company, laid out as on the maintenance screen.
