Glossary

Glossary

Analysis Code

Analysis codes are user-defined categories for assets. All analysis codes are held under the system reference code 'ANTY'.

Within these codes, detail codes exist. For instance, the analysis code 'ATP' (asset type) may hold the detail codes 'BLDG' (building) and 'VEHC' (vehicle).

Asset

The assets of a business are those items which are used in carrying out the activities of the business, but are not directly consumed.

Book Profile

This holds some of the rules for performing the depreciation calculations against an asset. It is used in conjunction with the depreciation book for that asset.

Book

A cost book is created if you wish to generate General Ledger accounts for asset cost values.

A depreciation book holds details of the depreciation rules for an asset. These are used in conjunction with the depreciation book profile when performing depreciation calculations.

Book Summary Balance

If an asset has dependent assets and these dependants have depreciation books, then the parent asset will have a book summary balance. These hold the accumulated values of all the dependants' depreciation and book values.

Book Value

An asset depreciation book includes a book value. This is equal to one of the following, depending on the valuation method specified on the book profile:

Asset cost

Replacement cost

Revaluation value

Cost Book

A type of record created if you wish to generate General Ledger accounts for asset cost values.

Dependent Asset

An asset which has been created with a link to a parent asset, i.e. a parent asset code has been entered against this asset.

Depreciation Book

A record which holds details of the depreciation rules for an asset. These are used in conjunction with the depreciation book profile when performing depreciation calculations.

Depreciation Method

The way in which depreciation is calculated for an asset. There are many accepted ways of calculating depreciation, and the system is designed to enable you to use your preferred method.

Item

When performing any form of asset maintenance, an item is created. This holds details of posting period document date and the reason for being created.

Parent Asset

An asset which has other assets linked to it, i.e. this asset has been entered as the parent asset code of one or more other assets.

Report Manager

A procedure which enables flexible sorting, sequencing and totalling of Fixed Asset reports.

Session

A group of items / transactions created at the same time are grouped by a unique session number. This holds details of the type of session, who created the session, when it was created and where.

Skeleton

When Fixed Assets is installed, many reference codes are provided in the 'skeleton' company '##'.

Where reference codes are used, the system will first look for them in the company being processed. If they are not found, it checks the '##' company, **if** the company profile allows it.

Assets can be set up in the skeleton company '##', and a new asset for your company can be based on such a skeleton asset. This can save keying time and avoid errors.

Although skeleton assets can be created, amended or deleted, no data is passed to the General Ledger for these records.

Summary Balance

If an asset has dependent assets, then the parent asset will have a summary balance. This holds the accumulated values of all the dependant's cost values.

Transaction

When performing any form of asset maintenance which affects any asset cost or depreciation values, a transaction or a series of transactions are created. These transactions record any change in the value, i.e. the difference between old and new values.

Transaction Type

Each transaction created has a numeric transaction type (e.g. calculated depreciation is type '325').

The transaction type works in conjunction with the structured General Ledger accounts set up in Fixed Assets. The General Ledger accounts are generated, and the transaction value is posted to the General Ledger.
