Chapter 4

Utilities

AFI Utilities

There are four options on the Utilities menu:

The Maintain Application option is the first to be used after the AFI has been installed. It enables you to activate the link between the AFI and the application in question, and to enter a default account for the journals posted.

The Archive Data option saves AFI data to magnetic media, freeing disk space as required.

The Maintain Data Dictionary option shows the application data fields available to the user within AFI. If you remove the 1 from a field, that field will no longer appear in prompt windows, but can still be entered and used.

The Test Account Generation option allows you to test an account code rule after setting it up and before assigning it to a posting definition, based on data you specify.

Maintain Application

1... 2...

This facility enables you to specify the application defaults and, for each target company, the General Ledger suspense account code to be used where necessary.

*Note: It is also used to activate AFI for the specified source application, via **F8**.*

Take *Maintain Application* and, having selected an application if necessary, the Application Maintenance screen is displayed.

```

13-05  SF  MW  KS  IM  II  KENB20A  PET179S2
  
```

Fields:

Journal Default - Source Co

This is the source application default company code which is displayed when creating a journal.

Enter the two character code of a valid company defined in the source application.

Journal Default - GL Co

This is the default General Ledger company code displayed when creating journals.

Enter the two character code of a valid company defined in the target General Ledger.

Consolidate Postings?

0 - Consolidation is not to take place when posting journals from AFI to the General Ledger.

1 - Allow consolidation to take place for posting definitions defined as consolidatable.

Consolidate Across Source Sessions ?

0 - Prevent consolidation across data originating in more than one source application session.

1 - Allow consolidation to take place across source application sessions for posting definitions defined as consolidatable.

Automatically Update?

0 - Initiate update of the target application manually.

1 - Allow automatic update of the target application with journals created in AFI. No listing is produced.

2 - Allow automatic update of the target application with journals created in AFI. A listing is produced.

Cost Accounting Active?

0 - You do not wish to use AFI to post to the Advanced Business Costing application.

1 - You do wish to use AFI to post to the Advanced Business Costing application.

Cost Accounting Company

If you do wish to use AFI to post to the Advanced Business Costing application, then enter the target Advanced Business Costing company here.

Maintain Suspense Accounts

For each General Ledger company to which the AFI is to make postings, a suspense account needs to be specified. If the AFI creates an unbalanced journal, a balancing entry will be made and posted automatically to the suspense account specified here.

Fields:

Company Code

Enter the code of a valid company defined in the General Ledger to which postings are to be made.

Suspense Account

Enter a valid General Ledger account code which is to be used as a suspense account.

2 - To change existing entries in this category.

4 - To delete existing entries in this category.

Functions:

F5

Refresh. This can be used to refresh the screen after entries have been made.

F8

Change link status.

Note: The setting of the link status is crucial to the running of the AFI. Always ensure that it is correctly set.

Journals will not be posted to the target company as long as the link status is set to 'inactive'. F8 changes the status of the link between AFI and the target application from 'active' to 'inactive' and vice versa.

For certain applications, including Sales Order Processing and Service Management, the status 'BFI mode' is displayed when you set AFI to 'inactive'. This is because, for these applications, journals will continue to be posted to the General Ledger by the Basic Financial Integrator, which cannot be deactivated.

Once the link status has been set to active, transactions from the source application will be made available for processing by AFI and no further direct postings will be made from the source application to the General Ledger, (i.e. the BFI mode of operation will not be used).

Press **Enter** to update any entries you have made.

Archive Data

2/FIU

This option enables you to delete or list data which has been transferred from AFI. Transactions which are held in AFI awaiting posting are not affected.

Available options are as follows:

- Archive data, and print a listing.
- Archive data, with no listing.
- Purge data (i.e. delete without saving), and print a listing.
- List the data (no archive or purge).

Take the *Archive Data* option to see the List / Purge Transactions screen.

```
FI910                      Advanced Financial Integrator  User TESTQA    18/09/96
Current Application.: Inventory                      12:10:01
List/Purge Transactions

Please select which application is to have its transactions listed and/or
purged, and whether the data is to be archived to media or not.
Please note that all of these options affect only data which has been fully
posted across to the Target Applications.

Source application . . ? IN

Run option . . . . . 3  3=Archive and list
                       2=Archive
                       1=Delete and list
                       0=List only

-----
F3=Exit  F4=Prompt  F8=Proceed  F12=Previous

11-29    SF      MK      KS      IM      II  KENB20A  PET179S2
```

Fields:

Source Application

Enter the source application relative to which transactions are to be archived, purged or listed.

Run Option

- 3 - Archive and list
- 2 - Archive
- 1 - Delete and list
- 0 - List only

Press **Enter** to validate the selection screen.

After selecting the required run option, press **F8** to proceed.

Functions:

F8

Proceed. This is used to proceed with the function after selecting the source application and run option.

Maintain Data Dictionary

3/FIU

The AFI data dictionary defines the fields which can be specified in AFI maintenance functions.

Option	Field
Journal conditions	Journal condition field
Postal definitions	Value field to post
Account rules	Consolidation control field
	Default posting account
	Quantity field to post
	Data to test (Alternative rule)
	Field name (Rule input)

The dictionary fields are grouped by files, for example, customer master, invoice headers, invoice lines, etc.

For each application, a subset of appropriate data dictionary fields are available in a prompt window when performing the AFI maintenance functions.

All the fields available to the AFI are present in the data dictionary, which is installed with the application.

Although the basic dictionary contents cannot be changed by the user, this option enables you to:

- Amend field description.
- Remove a field from the **F4** prompt window. Such a field will still be available for input during AFI maintenance but will not be visible within the prompt window.

Take the *Maintain Data Dictionary* option to see the Data Dictionary Maintenance screen.

FI015	Advanced Financial Integrator	User TESTQA	18/09/96
Current Application.: Inventory			12:10:36
Data Dictionary Maintenance			
Field	Display in Window		
		Calculated values

		+	
F3=Exit F10=Allow update of description Enter=Update			
08-24	SP	MM	KS IM II KENB20A PET179S2

Fields:

Field

The fields are listed so that all fields in the same file appear together, with the file description highlighted at the top.

Display In Window

1 - The field appears in the window. This is the default value.

0 - Prevent a field from appearing in the window.

Functions:

F10

This key toggles between enabling and disabling the updating of field descriptions.

When you have made all the changes required, press **Enter** to update, then **F3=Exit** to exit.

Test Account Generation

1... 11/FIU **2...**

After setting up an account code rule it is important to be able to test it prior to assigning it to a posting definition. This facility enables testing of an account code rule based on data you specify.

Depending on the rule logic, an account code and its default extension as specified on a journal posting definition, can be modified or entirely replaced by the rule specified on the journal definition.

To test the rule, the journal default account and its extension would normally be entered. The data string would contain test data input to the rule. On pressing **Enter**, the test function takes default account code and extensions and applies the rule logic, ledger or template level structure and conversion logic to derive the account code and extension which would be posted.

Take the *Test Account Generation* option to see the Test Account Code Generation screen.

```
FI552                Advanced Financial Integrator  User TESTQA  18/09/96
Current Application.: Inventory                    12:14:21

Test Account Code Generation

Rule no. . . . . ? . _ 1 *****
Default account code ? . 701100
Default extension code . 550011002100001

Data string . . . . . *...+... 1 ...+... 2 ...+... 3 ...+... 4 ...+
                        ABCDEFGHIJKLMNOPQRSTUVWXYZ1234567890|"?%&'({)

Derived account code . : 701100 *****
Derived extension code :

F3=Exit  F4=Prompt  F5=Refresh defaults  F12=Previous
13-27    SF        MK        KS        IM        II  KENB20A  PET179S2
```

Fields:

Rule No.

If you already know the rule number to test enter this in the second input field.

Default Account Code

Enter here the GL account code to which you wish to apply the account rule to create a new account code. This is only applicable where the account rule does not generate an entire account code.

Default Extension Code

To create a new extension code. This is only applicable where the account rule does not generate an entire account code with extension code.

Data String

Enter here the input data string corresponding to that which you would expect to be extracted from the source application to govern the creation or modification of the General Ledger account code. For example if the rule is based on customer class / item type, enter here (as one data string) a typical customer class / item type you would expect to be extracted from the source application.

After entering the Test Account Code Generation fields press **Enter**. The account code rule, using the input data string, will be applied to the default account code and the derived account code and derived extension code will then be displayed for verification. If any errors are found in the derivation routine, or if the generated account code is not on the chart of accounts or the extension code is invalid, an error message is displayed.

Functions:

F5

Refresh the screen, redisplaying the values which are shown when the routine is first called.
