Glossary

Glossary

Application Manager

A JBA application used to manage your JBA applications from a security, menu design, back up etc. point of view.

Application Menus

A menu is a screen listing the functions available, and enabling the user to select a function. Menus may be tailored to a user's specific requirements.

Application Reference Data

This is the basic data which you set up and without which the application cannot function - for example, supplier details, or reason codes.

Archive

Facilities are provided whereby redundant or old data can be removed from the system. Archived data will normally be held on either magnetic tape or cartridge, and can be restored for enquiry and report purposes.

Audit Trail

It is vital that a complete record of all data entries and amendments be kept in order to comply with accounting regulations and to provide a means of tracking the provenance of any errors. The Accounts Receivable application provides a full range of such auditing facilities

Bal B/F

See Balance Forward.

Balance Forward

A method of accounting, where at month end all outstanding customer invoices are summarised and held on the customers account as a transaction.

Base Currency

When setting up a new company a base currency must be specified. This is the currency into which any non-base currency will be converted for the purposes of enquiry, reporting and accounting. Once postings have been made to the company the base currency cannot be changed, so it must be decided with care. If the Accounts Receivable application is linked to a General Ledger, its base currency must be the same as that of the General Ledger.

Batch Control

The Company Profile can be set up to allow transactions to be posted in batches for control purposes. Accumulated batch values are then validated against a given batch total. Unlike **Session control**, this function is optional.

Bill of Exchange

See **Collection document**.

Cash Allocation

The cash allocation menu options enable you to record the receipt of cash and to allocate that cash to existing invoices.

Cash Management

A JBA application which is used to manage cash flow situations and perform Bank Reconciliations etc.

Chart of Accounts

A set of codes created in the JBA General Ledger which provides analysis of Profit and Loss and Balance Sheet accounts.

Chase Letter

See **Dunning letter**.

Collection Document

A collection document or bill of exchange is a guaranteed negotiable payment which may be issued *to* the company by its customers, or *by* the company to its suppliers as a promissory payment of an outstanding debt. When a collection document is accepted or issued, it is posted to the company's account to reduce

the outstanding debt. On maturing, the document is exchanged for cash - as a payment or a receipt.

Company Profile

Accounts Receivable is a multi-company application, and a number of parameters for each of its companies must be set up before the application can be run. The Company Profile contains all the basic rules within which a particular company is to operate.

Consolidation

A method of grouping together a set of customers' transactions.

Contra Accounting

A trading partner may often be both a supplier and a customer. Where this is the case, the contra accounts facility establishes a link between the supplier and customer accounts. This link causes an Accounts Payable payment to be reduced by the amount in the contra account in Accounts Receivable.

Control Account

The control account holds values posted from all the accounts of a sub-ledger beneath it. It cannot be posted to directly.

Country Code

Depending on where it is used, the country code may either control which *international* options are available to users, or it may simply control the format of the bank account window to appear when entering bank details.

Credit Note

Also called a *credit memo*. It is raised in Distribution or in Accounts Receivable, sometimes as a miscellaneous credit, but usually to cancel an invoice.

Credit Checks

A process performed within the JBA Sales Order Processing system where the customers balance outstanding and order commitment are compared against a predefined credit limit and orders suspended if the credit limit is succeeded.

Currency Code

In Accounts Receivable, a default trading currency may be defined to a customer, and a transaction may be entered in any currency defined to the system, provided that the company being used is defined as a multi-currency company. The three-character currency code refers to the currency to be used, and provides default exchange rates, etc.

Customer Code

The unique identifier assigned to each of the company's customers.

Default

A default value is a value stored by the system for use when no other value can be found. For example, when setting up customer details, a default payment method can be entered. This method will be used for any invoice which does not have its own payment method defined.

Delivery Address

Up to 999 delivery addresses can be set up for a customer, enabling deliveries to be sent to a customer's branch offices, for example.

Discount

A value or percentage to be deducted from the payment value if payment is made by the due date.

Disputed Invoice

This is an invoice which is in the process of being queried by the customer.

Disputed Invoice Reason Code

A reason must be assigned to any disputed invoice. These reasons are defined using the Accounts Receivable Maintenance menu, and each is assigned a code.

Dissection

The breakdown of a single transaction value across a number of General Ledger accounts, or to VAT codes.

Due Date

The date on which payment of a transaction is due from your customer.

Dunning Letter

A Dunning (or 'chase') letter is used to inform customers with overdue debts of the status of their account, the amount overdue, and the action requested to regularise the account.

Effectivity

It is often useful to be able to define the validity dates of an entity, so that the system can prevent its use outside of these dates. This period of validity is called an entity's *effectivity*.

Extended Terms

If payment of an item is to be spread over a period of time - paying different amounts each month, for example - then the best way to achieve this is to set up an extended terms code within the Cash Management application, and to define the payment terms to the code.

Extension Codes

An extra level of analysis provided within the General Ledger Chart of Accounts.

Flag

A trigger to activate or deactivate certain facilities and parameters within the application.

General Ledger

A JBA application used to analyse cost and expense and produce Profit and Loss and Balance Sheet reports. Otherwise known as the nominal Ledger.

Hash Total

The batch control total is always entered as a hash total, particularly when transactions of various currencies are entered. For example, if you are entering one invoice for 100 pounds sterling and another for 100 French francs, then the hash total is 200.

Historical Data

Application data which has been archived (i.e. is no longer considered current data), but which is retained (usually on tape), and may be restored for enquiries and reports.

Inventory

A JBA application used to handle stock control information.

Inter-company Accounting

You can flag any company as having inter-company status within the General Ledger. Having done so, you can link your company with other such companies within the same application. When posting transactions to another company, you would specify that company's code and process the transaction in the normal way.

Item

In the Accounts Receivable application, an item is a transaction document which has been entered onto the system.

Menu

See Application Menu.

Multi-currency

Trading in several currencies, linked to a single currency or multi-currency General Ledger.

Multi-company

The system is designed to control more than one independent company, or several companies reporting to a controlling or reporting company.

Open Item

An open or outstanding item is an item which has been authorised but not yet fully paid.

Open Item Account

A customers account where all outstanding items are left on the customers account and not summarised into a balance forward.

Our Reference

This item reference number may, depending on the setting of the Company Profile, be allocated automatically by the system, or entered by the user.

Outstanding Item

See **Open item**

Parameter

A characteristic or constant factor defined by you or already in the system, which determines the specific form or specific limitations of a function.

Payment Method

The way in which a supplier is paid - for example, by cheque, collection documents or BACS

Payment Terms

Defines the way in which the payment due date is calculated for each transaction. See also **Extended terms**.

Period

The units into which a financial year is divided for accounting purposes (usually 12 or 13). These are the same for each financial application.

Period Close/Open

The procedure which completes the processing for the current period. The next period may then be opened.

Prime Currency

The prime or *transaction* currency is the currency in which a transaction is made, as opposed to the **Base currency**, into which transaction values will be converted.

Prompt

A facility which brings up a list of records relating to a data entry field. To activate, enter a '?' and then press **F4**.

Protocol Number

The sequential number allocated to a VAT transaction in a *VAT register*. See **VAT registers**.

Rate Code

A code created within the General Ledger currency system which holds groups of exchange rates.

Reason Code

A code which may be used to define the reason for a credit note or journal. See also **Disputed Invoice Reason Code**.

Sales Analysis

A JBA application which analyses Invoicing information to produce Sales Analysis reports and inquiries.

Session Control

When starting to enter transactions, the system automatically sets up a session number. All transactions entered at once will then be part of that session. The session is the principal method of control in transaction processing, and provides the information required to satisfy audit requirements.

Spread Elements

These are the elements which make up a complete **Extended terms** definition.

Standard Letter

A standard letter is produced to inform customers about matters other than credit control. See also **Dunning letter**.

Text

Information which can be logged against a customer or transaction providing information to the user.

Transaction

A general term used to describe a unit of financial data submitted to the application - such as an invoice.

Transaction Currency

Same as **Prime currency**

Transfer

The journal used to correct a mis-posting from one account to another

Utilities

A set of procedures for verification, utilisation and management of the application database. They are not required during normal operation, and when used may require technical support.

VAT

Value Added Tax, a method of paying tax to a government based on the value of goods purchased/sold. Vat codes and rates are specified in the General Ledger application.

VAT Accounting

The way in which Value Added Tax is posted, recorded and accounted for. See "VAT Sub-system" in General Ledger for more details.

VAT Registers

This is a facility to enable the producing of VAT reports based on tax area. The codes are set up in General Ledger by the user, and relate to a particular tax office. This facility will be used mainly in Italy.
