## Chapter 5

### World Trade Catch-up

# Introduction to World Trade Catch-up

World Trade Catch-up gathers the data required to print Intrastat and ESL reports for movements of goods that occurred before you installed World Trade. It also verifies that the VAT codes determined by Sales Order Processing and Purchase Management or Accounts Payable, since 1<sup>st</sup> January 1993, are the same as those that would have been applied by the World Trade VAT code determination routines.

The World Trade catch-up programs establish which transactions must be retrospectively created in World Trade. It also writes reports that list discrepancies between VAT posted to the ledgers since 1<sup>st</sup> January 1993 and the VAT that would have been recommended by World Trade.

*Note: Only run the World Trade Catch-up options when you install World Trade.*

Before you run these programs you must create the World Trade customers, suppliers, stockrooms and World Trade extension data. If you do not do this, the transactions written to World Trade will fail the Intrastat reporting verification procedure.

The default mode of transport on the World Trade company profile will be used for all purchase movements. The structure of the Goods In file means that certain information will be summarised, for example, returns on the same day as the original goods in movement generates one summary movement.

JBA advise you run the jobs that perform the Catch-up in the following sequence:

1. Enter all master file data, as documented in the Maintenance section.
2. Run standard start-up job, as documented in Utilities.
3. Run the Extract Sales Movements job, Create Disposal Movements from World Trade, or Print Invoices from the Sales Order Processing Reports.
4. Run Catch-up jobs in any sequence.

# Purchase Movement Catch Up

## 1/WTC

This job reviews the Goods In file for movements of goods after a specified date and create an EC movement record for each intra-EC movement.

You can use this to produce the acquisition side of the Intrastat reports for the retrospective periods.

## Catch-up Purchase Movement Window

 To display this window, select Purchase Movement Catch-up.

Use this window to specify the start date for the query. The Goods In file is reviewed to identify movements of goods after the specified date and to create all the necessary movement records.

### Fields:

#### Process Movements After

Enter the date after which EC movements are extracted from the Goods In file. This should be in the format DD/MM/YY.

 Press **Enter** to validate the date entry, then select **F8=Submit** to submit the report.

# Verify Purchase VAT Codes

## 2/WTC

The VAT code verification reports identify transactions for which the actual VAT posted is not the same as would have been posted with World Trade attached. These reports should be used as part of installing World Trade, so that if transactions are identified for which incorrect VAT was posted, correcting journal entries can be made.

This report reviews all movements in World Trade that originated from the Purchase Management system and have been invoice matched.

The report attributes are:

- Frequency - At Point Of Installation
- Stationery - Standard Listing Paper
- Print Positions - 132
- New Page - Page Overflow
- Totals - For Each Invoice
- Selection - None
- Sequence - Invoice number.

Select Verify Purchase VAT Codes, then select **F8=Submit** to submit the report.

## Sales Order Movement catch-up

### 3/WTC

Use this procedure to review historical transactions originating in the Sales Order Processing application and written to the World Trade database. EC movements are created, where appropriate, for despatches recorded after the date entered in the Installation procedures from within World Trade Utilities, that is after the date used in the Flag Invoices as Movements Created procedure.

This produces the disposal side of the Intrastat reports for the retrospective periods.

Select Sales Order Movement Catch-up. Then select **F8=Submit** to submit the report.

# Verify Sales Order VAT Codes

## **1...** 4/WTC **2...**

The VAT code verification reports identify transactions for which the actual VAT posted is not the same that would have been posted with World Trade attached. These reports should be used as part of installing World Trade, so that if transactions are identified for which incorrect VAT was posted, correcting journals entries can be made.

This report calculates for each invoice line despatched after the entered date, the VAT code and values that would have been posted with World Trade attached. A line is printed on the report only if there is a difference between values.

The report attributes are:

- Frequency - At Point Of Installation.
- Stationery - Standard Listing Paper.
- Print Positions - 132.
- New Page - Page Overflow.
- Totals - None.
- Sequence - Invoice number.

## Verify Sales VAT Window

To display this window, select Verify Sales Order  
Vat Codes.

This screen prompts for a despatch date after which Sales Order Processing will be queried.

### Fields:

#### Process Despatches After

Enter the start date for the report.

Any sales invoice lines despatched after this date for which the actual VAT details are not the same as the World Trade recommended VAT code will be selected for the report.

Select **F8=Submit** to submit the report.
