## Chapter 6

### Transaction Processing

# Transactions In And Outside Of Job Management

This section deals only with costs that are entered against a job. The transactions may come from within Job Management or from transaction sources that are outside the module. Both types of transactions are discussed in this section.

In summary, Job Management cost transactions consist of:

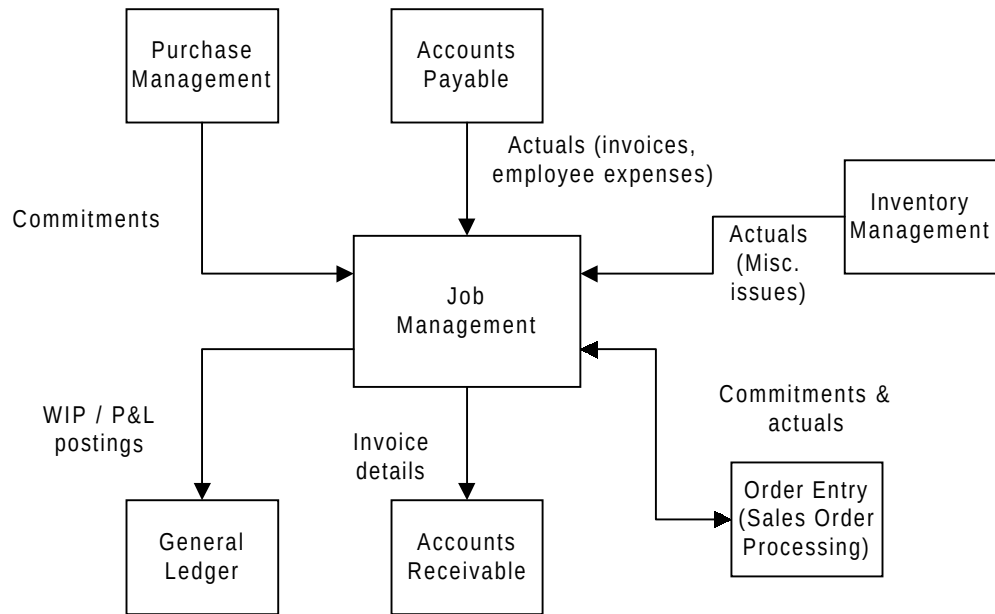

- Employee timesheets.
- Employee expense-sheets.
- Direct transactions.
- Standing costs.

Cost transactions outside of Job Management facilitate the following:

- Employee expense-sheets and direct transactions via an account in Accounts Payable.
- Issue of miscellaneous inventory (Inventory Management).
- Capturing the cost of inventory and charges for a parts list (Sales Order Processing/Advanced Order Entry).
- Costs captured during manufacturing on a bill of material (Production).

Every job detail must be classified as a fixed price, chargeable or non-chargeable job. For a chargeable job detail, any cost transaction can be invoiced to the customer with mark-up percentages attributed to that type of cost transaction. The cost, however, is posted to an account regardless of the price type.

The following diagram shows how some of the main transactions cross application interfaces:

## Costs Via Purchase Management

Purchase orders can be raised and costs captured against a job detail. Many purchase orders can be raised for each job detail.

The value of a purchase order remains as committed costs until goods have been received and matched against the supplier invoices.

The interface is driven primarily from Purchase Management, where you take an option to enter an order (if new).

The job number is what links the Purchase Management and Job Management interface. When the link to Job Management is active, the job number on the purchase order line is entered with a Job Management detail code.

The job number can be up to 13 characters long, and the total length of a job detail is a maximum of 13 characters.

The first six characters in this field are reserved for a job header number. The second four represent the sub-job part of a job detail, while the final three are reserved for task numbers.

For example, if you wish to raise a purchase order against a sub-job called MJOB JOB, enter MJOB JOB in this field where the job header part of the field is contained within the first 6 characters and thus two blanks follow the four character job header. Or, for a job detail with job 'COMPIN', sub-job 'HWIN' and task 1 enter 'COMPINHWIN001' in this field.

*Note: If you are not using the 'task' level you do not have to enter '000' as the last three characters, as the system will do this for you.*

Every transaction within Job Management has an expense code, so enter the expense code attached to the job type associated with the job detail.

You have a choice as to where you can enter the job number and expense:

- On the order header.
- Leave the job number and/or expense field on the order header blank, and press **Enter** to see the order line details. You can now enter multiple purchase lines against a number of job details. The same rules apply for the job number and expense field here as they do with the header screen. For example, if you enter 'COMPIN' in the job number field for an item, the line shows 'COMPIN 000' as a valid value.

On completion of the order entry and printing of the order, Job Management can pick up the value of the cost as a purchase commitment.

The update to Job Management of committed costs from Job Management takes place in batch. After purchase orders have been completed, use the Update Commitments option within Job Management to update commitments.

## Costs Via Accounts Payable

Costs can be built up from Accounts Payable for Job Management direct transactions and employee expenses. If you specify on the company profile that Accounts Payable is active, you can then specify when entering an Accounts Payable invoice the type of Job Management detail that is required.

The facility is available within the following options, all in Accounts Payable:

- Confirming Log Entries.
- Direct Posting.
- Journal Direct Posting.

When you go into your new session to make the posting, you have to enter a valid GL account to post to. If this account is the Accounts Payable holding account for Job Management, then the Type of Entry Selection Window will be shown. The window is shown only once per session, and enables you to specify whether you are breaking transactions down into employee expenses or supplier-related documents.

## Type of Entry Selection Window

The Type of Entry Selection Window appears when you are updating your first posting within the session, and enables you to specify whether you are breaking transactions down into employee expenses or supplier-related documents.

10-32 S4 MW KS IM II KENB20A PET149S2

### Fields:

#### What Type Of Document...

- 1 - You are posting supplier invoices, credits or journals. When you press **Enter** you will be taken into the Job Management Direct Transaction Entry Screen.
- 2 - You are posting employee expenses. When you press **Enter** you will be taken into the Job Management Employee Selection Screen for expenses entry.

On the screen you see you can enter a complete Job Management breakdown of the Accounts Payable and allow multiple transactions to be entered for one invoice.

*Note: The document type selected here will be used for the rest of this session.*

When the batch of Account Payable invoices is complete, the system triggers simultaneous updates to the General Ledger and Job Management, ensuring both balance.

The differences between direct transaction processing within Job Management and this version are as follows:

#### Control Total

The control totals come from the Account Payable batch and invoice total, not from Job Management.

#### Trans Source

The transaction source is pre-filled with 'PL' and cannot be changed.

**Ext Reference**

The external reference defaults to the supplier code.

**Date**

The date defaults to the document date and cannot be changed.

**Quantity**

The quantity defaults to that entered against the Accounts Payable GL dissection.

**Cost**

The cost defaults to the outstanding document value.

**Currency**

The currency defaults to that of the document and cannot be changed.

**Functions:**

**F8**

Update. This returns you to the Accounts Payable supplier selection screen.

Batch end and review procedures are the same as for the Direct Transactions option, with a discrepancy screen if it does not balance.

## Employee Expenses Entry Screen from AP

### Fields:

#### Employee Number

Enter the employee for whom you are to enter expenses.

#### Week Number

Enter the week the expenses apply to.

Press **Enter** to go to the Expenses Entry Screen.

## Expenses Entry Screen

Press **Enter** on the Employee Expenses Entry Screen From AP to see the Expenses Entry Screen.

The differences between expense processing within Accounts Payable and the 'stand-alone' version are as follows:

- The batch number and control totals come from the Accounts Payable invoice entry.
- 'Total Employee Expenses' is the total invoice value and is already displayed.
- **F23** (cancel batch) is not allowed.
- **F8** end batch returns you to the supplier selection screen within Accounts Payable.
- Employee number is filled in if you are using the common supplier and employee codes as defined in the Job Management company profile.
- The details screen has no VAT fields, because the VAT is dealt with within Accounts Payable.

The processing on the details screen is identical to that described in the stand alone function.

## Miscellaneous Inventory Costs

To record a miscellaneous issue, take the Miscellaneous Issue (Physical) option within Inventory Management. The standard miscellaneous issues screen is displayed, with the addition of job/sub-job/task fields to enter the relevant job detail.

The way in which the issue is handled from then on depends on the setting of the 'Post Miscellaneous Issues Direct' flag on the Job Management company profile. If it is 0, then you must take the Post Inventory Issues option within Job Management. If it is 1, then the posting is done immediately and automatically.

To assist in AFI posting, Job Management-related Inventory movements are written with the following data elements.

- Miscellaneous Physical Issues.
- Movement source - J.
- Movement type - JM.

## Inventory Costs Via SOP/AOE

If you need to supply Inventory Management items to a site in phases and in a more controlled manner than using ad hoc options, Job Management's integration with SOP/AOE enables it to pick and despatch items, but without producing an invoice for each despatch.

If you want the costs to be sent back into Job Management, then you must define a list of parts needed for a job detail. Job Management interacts with SOP or AOE to define the list of parts required. SOP then progresses the list of parts, now defined as an order, through to confirmation of despatch. Confirmation of despatch prevents the creation of an invoice and posts the inventory costs to Job Management instead.

*Note: Each job detail can have only one sales order per task.*

If a parts list is totally despatched, you cannot add more parts to it. Instead, create another task with a new parts list for the new parts.

To keep a parts list open, add a dummy item to it, which is never despatched, thus leaving the sales order open.

While the order is being progressed, the sales order captured by Job Management is recognised as a committed cost for that job detail.

The link to standard SOP enables you to produce picking and despatch notes using standard functions and allows access to all the normal enquiries for a sales order.

If you do not require the interface to SOP, but do wish to capture Inventory Management costs against jobs, use the Miscellaneous Issue (Physical) option from within Inventory Management. Costs are updated within Job Management either immediately or in batch.

Ensure the following:

- The AOE, SOP and Inventory companies are the same as the Job Management company.
- There is a one-to-one relationship between a sales order and a job detail.

See the company profile for details of the fields that are relevant if you have SOP actively linked to Job Management.

To assist in AFI posting, Job Management related Inventory movements are written with the following data elements.

- Customer Issues.
- Movement reason - JM.

*Note: If the job is a T&M job, it uses the setting in the materials charge field to decide whether it is to be charged or not. If this setting is 1 or 2, then the system will bring across the charge value from SOP.*

## Creating Parts Lists Via AOE

You may create a parts list within AOE for a job detail, from which the costs of Inventory Management items can be captured for that job detail.

The Inventory Management and Job Management company profiles must be set up as outlined in the previous section.

If the SOP is active then the **F15** (parts list) function key is available in the job details screen. The expense type for Inventory defined on the company profile must be a valid expense type for the job type associated with the job header.

If **F15** is pressed, and no records exist for a job detail sales order, you are automatically taken to standard order entry line maintenance.

If on the other hand, a record does already exist in the job details sales orders and the **F15** key is pressed, you are taken to the standard order line amend screen. You can then amend the order.

The conclusion of creating or amending the parts list, including order headers and trailers is part of standard AOE functionality.

*Note: If a sales order has been completed or deleted and the order has had no despatch confirmed, then Job Management will allow you to create a new order. However, if the order has had confirmation of despatch, then, you cannot take the **F15** for that job detail. Instead, you receive an error message 'Parts List no longer active'. If the 'SOC' process code is active when a sales order is created, the status code of the job detail will be changed to that associated with the 'SOC' code.*

## Creating Parts Lists Via SOP

If you are not using Advanced Order Entry but would like to create a parts list in SOP, then instead of accessing an AOE screen as in Creating Parts Lists Via AOE, you access an SOP screen.

You must first enter the company profile in Inventory to ensure that the SOP link is attached (rather than AOE).

# Direct Transactions

## 1/JCA

Direct Transactions is a supplement to the other methods of entering costs into the Job Management system.

This facility provides a general-purpose method of cost entry which could cover transactions like opening balances, or adjustments such as overhead allocations, cost smoothing and one-off transfers between jobs.

This facility is available when transferring invoices from the Accounts Payable log into the ledger and when entering invoices directly into the ledger.

Take the Direct Transactions option to see the direct transaction header fields.

## Fields:

### Batch Number

You must enter a unique batch number. This unique batch number must exist within the manual range for direct transactions batch control already set up in your Job Management company profile.

If you receive a message prohibiting you from using the batch number entered it is because of one of the following:

The number is out of the manual range for the batch control.

The number has already been used. It is suggested that you keep a log of batch numbers entered.

### Control Value

You can enter a control value for the sum total of all direct transactions being entered in this batch. When finishing the batch you will be able to override this value so that it agrees with the actual accumulation of the direct transactions, or you can review the batch and amend any transactions.

### Period Number

The posting period must be in the format YYPP where PP is a period between 01 and the maximum defined for the year (normally 12 or 13). The posting period cannot be less than the GL period.

Press **Enter** to see the first Direct Transaction Entry Screen.

# Direct Transaction Entry Screen 1

| Charge amount...                                               |                               |                              |          |
| F4=Prompt F8=End batch F15=Review batch F17=Override rate code |                               |                              |          |
| F21=External text F23=Cancel batch                             |                               |                              |          |

## Fields:

### Job/Sub-Job/Task

Enter at least a job number. Depending on the job level you may optionally enter sub-job and task.

### Expense Type

Enter a valid expense type code.

The expense type entered must be valid for the job type of the job. Valid expense types for a job type are set up via the Expense Types option.

### Trans Source

Select a valid transaction source.

For identification purposes in reports, it is recommended that you use 'JM' for transaction source in Job Management.

### Trans Type

Enter a valid transaction type.

If the transaction type entered here is the same as that for timesheets or employee expenses on the company profile, then the external reference field must contain a valid employee number.

### Charge Code

Enter a valid charge code.

### Document Reference

The 'Auto Generate JM Ref Nos' field in the company profile controls whether you need to enter a reference here.

If you have set this flag on, then leave this field blank. When you review the transaction after you have entered the valid data, the system will enter a unique internal reference number.

If you set this flag off, then you must manually enter a unique number (8 characters). After validation, the reference is protected and used as the internal reference.

### **External Reference**

Enter up to a fifteen character reference field. This could be a part number if it is an inventory transaction. It must be an employee number if it is an employee related transaction.

### **Narrative**

A 25 character field is available to further describe the transaction.

### **Date**

Enter a date in the format DDMMYY.

### **Quantity**

Optionally enter a transaction quantity.

### **Cost**

The cost is the transaction cost.

### **Cost Currency**

The currency code of the cost. This defaults to the base currency of the GL company profile and may be overridden.

### **Re-Charge**

0 - Do not charge the customer for the time or materials allocated.

1 - Charge for time or materials. You cannot use this setting if the price type is fixed or non-chargeable.

2 - You will make the decision whether or not to charge when you are reviewing this transaction in the Chargeable Transaction Review option.

If you leave this field blank, the system will make it default to the entry on the Job Details Maintenance Screen 2. It will default to either the Chg Time or the Chg Mat value, depending on the expense type entered for this transaction.

### **Mark-Up %**

The application automatically defaults to the mark-up percentage of the expense type as set up in job type. This percentage can be overridden in this field for this transaction. The mark-up is applied to the cost and used to recharge the customer. It only applies to T&M jobs.

If no default mark-up percentage for the expense type exists and the charge code is 1, then a mark-up percentage or charge amount must be entered.

*Note: If cost currency differs to the income currency, then enter a charge value. The mark-up percentage for that expense type is not used.*

### **Charge Amount**

Optionally enter an amount to be recharged to the customer. You can record a charge amount against a reviewable transaction, and the amount will be used as the calculated value in the Chargeable Transaction Review option. This field is only valid if the Mark-Up field is blank.

If you wish to bill your customer the cost amount, do one of the following:

- Use an expense type with a zero percentage mark-up and set the Re-Charge field to 1.
- Leave the mark-up field blank and enter the charge amount figure the same as the cost amount entered.

## Functions:

### F8

End Batch. This function ends the batch. If you press **F8=End Batch** with no entries in the direct transaction screen, then the accumulated total remains at zero. Remember to press **Enter** before **F8=End Batch**.

### F15

Review Batch. Allows you to review a batch so that you can alter any details of entered transactions.

### F17

Override Rate Code. Provided that the cost currency is not the same as the base currency, then the currency rate code can be overridden.

### F21

External Text. Use this function key for any additional text information to appear on time and material invoices for this transaction.

### F23

Cancel Batch. Pressed twice, this cancels the batch and all entries are lost.

Press **Enter** twice for transactions in currency other than that of the default base currency - once to validate the rate code, the second time to validate the other data.

When you press **Enter**, the details you have entered are immediately transferred to the list of transactions which make up this batch. You can see this list by selecting **F15=Review Batch**.

Most of the details disappear from the screen, though certain ones - including the Transaction Type and Charge Code - remain as defaults for the next transaction you enter.

When you are satisfied with the transaction, select **F8=End Batch** to see the second Direct Transaction Entry Screen.

## Direct Transaction Entry Screen 2

Tip: The process of ending, reviewing and cancelling the batches works in the same way as the timesheet and employee expenses batch.

|                                                              |                               |               |                 |

| - accumulated                                                | 220.00                        |               |                 |
| DISCREPANCY.....                                             | 100.00                        |               |                 |
| Correct control total or press F key to correct transactions |                               |               |                 |
| F10=Enter more items F15=Review batch F23=Cancel batch       |                               |               |                 |

### Control Total

This field displays the control value entered on the batch header screen. If the value displayed in the 'Discrepancy' field is not zero, you can:

- alter the control total to match the accumulated total.
- or re-enter the batch to amend or add entries.

The control total field is a hash total, and is not concerned with multi-currency calculations. If, for example, you have entered 1000 dollars and 530,000 francs, then the control value is 531,000.

### Accumulated

This field displays the value actually entered in the batch.

### Discrepancy

This field displays any discrepancy between the accumulated and control totals.

This field must be zero before the **F8** key is made available for you to update the batch.

Press **F8=Update** to update.

### Functions:

#### F8

End the batch. This key is displayed only if there are no discrepancies.

**F10**

Enter More Items. Enables more direct transactions to be added to the batch.

**F15**

Review Batch. Enables the batch to be reviewed for amendment.

**F23**

Cancel Batch. Enables you to cancel the batch. Pressing **F23** twice cancels the batch and all entries are lost.

Two reports are then generated, the Job Management posting validation report and the interface file validation (GL report).

# Employee Timesheets

## 2/JCA

The time recording facility within Job Management is progressed as a stand alone feature. A timesheet is a screen within the application that enables you to enter hours against an employee for specific dates over various jobs.

The time recording facility has a standard set of procedures from start to completion of a batch.

- A batch number is attributed, to which multiple employee timesheets can be entered in a batch.
- Each employee can have multiple jobs details entered on the one timesheet.
- The costs are based on the employee grade codes associated with the employee.
- Subsequent invoicing initially depends on the charge rate for an employee grade code and whether the job is a time & material type job.

At the end of timesheets entry, you can review and adjust the entries, finish the batch with agreeing control values, or you may decide to cancel the whole batch.

You may wish to record timesheet data on a periodic basis such as at the end of the week or month. However, it is possible to record the entries on a daily basis and update the job costs and post invoices periodically.

Timesheet data:

- Updates actual labour costs on both chargeable and non chargeable jobs.
- Calculates invoice values on time and material jobs.

The cost of the transaction line on a timesheet comes from the hours entered multiplied by the value of the hourly grade code (see Employee Grades).

Take the Employee Timesheets option. This is the starting point of all timesheet batches, although multiple timesheets can be processed in one batch. The following three fields are displayed:

### Batch Number

Enter a unique batch number. It is suggested that all batch numbers whether for time sheets or other costs should be logged in a manual system in order to keep track of last used numbers.

Until such time as the batches have been posted, you may review a batch and amend any details. Press **F19** to maintain a batch already used but which has not been posted to the accounts.

### Control Value

Optionally enter a control value in hours. This can be overridden if it disagrees with the actual hours entered in the batch.

### Example

You have to enter in a batch the timesheets of 100 employees who all work 40 hours in their normal working week. You might provisionally enter 4000 here, to highlight any variance.

### Period Number

The posting period must be in the format YYPP, where PP is in period 01 to max/year (as set up in the GL). The posting period cannot be less than the GL period.

Press **Enter** to see the screen which enables you to enter the timesheet hours for an employee. The total hours value must equal the total hours that will accumulate on the timesheet. The three fields are as follows:

### Fields:

#### Employee Number

Enter an employee number.

#### Payroll Period

Enter a period number in the format YYPP where PP is between 0 and 53.

#### Total Hours

Enter the total number of hours for this employee over the period.

### Functions:

#### F8

End batch. If you press **F8** with no entries in the timesheet screen, then the accumulated total remains at zero regardless of the 'Total Hours' entered here.

#### F15

Review batch. Allows you to review a batch so that you can alter any details of the timesheet.

#### F23

Cancel batch.

Press **Enter** to see the first Timesheet Entry Screen.

### **Job/Sub-Job/Task**

Enter a valid job detail.

### **CC**

A valid charge code must be set up which describes the type of timesheet entry.

### **Date**

Enter a date in the format DDMMYY.

### **Hours**

Enter positive or negative hours against this job for this charge code. The application calculates the cost in the base currency using the prime currency cost rate (see Employee Grades) and invoices the customer using the prime currency charge rate of the employee displayed at the top of this screen.

There is a maximum of 24 hours for any one date.

The sum of the hours accumulated on the sheet must equal the control hours entered on the previous screen.

### **Uplift Code**

A valid uplift code may be entered.

This will have the effect of uplifting the cost value of the time sheet hours by the uplift factor associated with the uplift code. A purpose of this code would be to calculate overtime.

The uplift code may be entered for any line on the timesheet. The default grade code that calculates the cost/income of the timesheet line is defined within Employee Grades. If the timesheet line (i.e. a job detail) represents a job that requires a different cost and rate code, then, you can re-select or override the cost/income rate categories.

### **External Text**

Up to 40 characters of text can be written on this line. This will be printed on the invoice for T&M jobs. If more than 40 characters of text are required then set 8 for More Text. This provides a further screen to enable more text to be entered. This applies to all lines.

If no text is written and the 'Invoice Hours Text' in job type has been set to 1, then Job Management defaults text to job number description, date, hours and rate charged.

Enter 6 beside a line and press **Enter** to see the Cost Category/Rate Override Window.

## Cost Category/Rate Override Window

The window may also show entry fields for income as well as charges, as appropriate.

F8=Update  
F12=Previous

### Fields:

#### Costs - Override List

Enter the cost list to override the default. This will be used to calculate employee hourly costs.

#### Costs - Override Rate

Enter the rate you wish to override the default. This will be used to calculate employee hourly costs. If you enter a rate here you cannot enter an override list as well.

#### Income - Override List

Enter the price list to override the default. This will be used to calculate employee hourly income.

#### Income - Override Rate

Enter the rate you wish to override the default. This will be used to calculate employee hourly income. If you enter a rate here you cannot enter an override list as well.

When you are satisfied with your entries, press **F8=Update** to update the timesheet. You will be taken back to the employee selection screen, to continue entering timesheets for other employees. This screen also enables you to review and amend previous entries (**F15**), or to cancel the batch altogether (**F23**).

When all the timesheets are entered, press **F8=Update** again. The second Timesheet Entry Screen for the batch end will be displayed.

## Timesheet Entry Screen 2

When all the timesheets are entered, press **F8=Update** again. The second Timesheet Entry Screen for the batch end will be displayed.

### Fields:

#### Control Total

This field displays the control value entered on the batch header screen. The control totals for timesheets are based in hours. If the value displayed in the 'Discrepancy' field is not zero, you can:

Alter the control total to match the accumulated total, or

Re-enter the batch to amend or add entries.

#### Accumulated

This field displays the value actually entered in the batch.

#### Discrepancy

This field displays any discrepancy between the accumulated and control totals.

This field must be zero before the **F8** key is made available for you to update the batch.

### Functions:

#### F8

Enables you to end the batch once there is no value in the discrepancy field.

#### F10

Enter More Items. Enables more timesheets to be added to the batch.

**F15**

Review Batch. Enables the batch to be reviewed for amendment.

**F23**

Cancel Batch. Enables you to cancel the batch. Pressing **F23** twice cancels the batch and all entries are lost.

The system will not automatically post timesheets data to Job Management. You must take the Post Timesheets option to do this.

# Employee Expenses

## 3/JCA

The ability to record the costs of employee expenses to a particular job number is available within Job Management as a stand alone function or attached to invoice entry within the Accounts Payable system.

This section describes the stand alone procedure, although the actual process for entering the details on the expense sheet is similar for both modes.

The expense sheet is used for calculating mileage costs and income as well as other user defined transactions.

The expense sheets are entered in batch, where one expense sheet represents the expenses for an employee over multiple jobs.

Take Employee Expenses to see the expense sheets header with the following fields:

### Fields:

#### Batch Number

You must enter a unique batch number. This unique batch number must exist within the manual range for express batch control already set up in your Job Management company. If you receive a message prohibiting you to use the batch number entered, it is because either;

Batch number is out of the manual range for the batch control.

Batch number has already been used. It is suggested that you keep a log of batch numbers entered.

#### Control Value

Optionally enter a control value for a sum total of all the expense sheets being entered in this batch. When you want to finish the batch you can:

Override this value so that it agrees with the actual accumulation of the expense sheets

Review the batch and amend any expense lines.

#### Period Number

The posting period must be in the format YYPP, where PP is between 01 and the maximum number of periods set up in the GL (normally 12 or 13). The posting period cannot be less than the GL period.

Press **Enter** to see three more fields on the employee selection screen:

### Fields:

#### Employee Number

Enter an employee number.

### **Week Number**

Enter a week number in the format YYWW where WW is between 0 to 53.

### **Total Employee Expenses**

Enter the total value of expenses for this particular employee. This figure must equal the total cost figure plus VAT.

### **Functions:**

#### **F8**

End batch. This function ends the batch. If you press F8 with no entries in the expenses sheet screen, then the accumulated total remains at zero regardless of the 'Total Employee Expenses' entered in this screen.

#### **F15**

Review batch. Allows you to review a batch so that you can alter any details of the expense sheet.

#### **F23**

Cancel the batch.

Now press **Enter** to see the Expenses Entry Screen.

6 - If you wish to recharge the expense to your customer, you may wish to further describe the details on the external text which appears on the invoice to that customer.

7 - Override currency rate code by changing the rate code or conversion rate, or you can enter the target currency value and allow the system to calculate the rate.

This can only be done on a line by line basis, so that any currency overriding is done by particular dates rather than overriding the whole sheet. This enables flexibility of expense sheets when currencies are fluctuating widely on a weekly basis but you do not wish to reset your currency rate codes in your GL every day. You will notice that each expense line must have a valid date.

### **Job/Sub-Job/Tsk**

Enter at least a job. Optionally enter sub-job and task depending on the job level.

### **CC**

A valid charge code must be set up which describes the type of entry expense.

### **Date**

The date must be in the format DDMMYY.

### **Net Amount**

Enter the net amount of the expense line.

If you wish to enter mileage expenses using the standard claim/charge rates for that employee, then do not use this field. In this instance, use the miles field and press **Enter**. If the data is validated, the net amount is automatically calculated. You may wish to override this net amount but any such changes will not update VAT amounts. Similarly, if you enter an expense value in the net amount field, then any further amendments to the net amount figure do not alter the VAT value.

### **Chg**

This is the recharge field. If you do not enter a value here, the system will default to the value in the Chg Mat field on the Job Details Maintenance Screen 2.

0 - Cannot be charged.

1 - The expense line is to be recharged to the customer on a T&M job. Recharge is not allowed:

- On fixed price jobs.
- Where the recharge flag for the materials part of T&M in job details for this job has been set to 0.

2 - You wish to review this line later before posting this transaction. You will be able to see the details in the Chargeable Transaction Review option before any invoicing takes place.

### **Miles**

If the expense line is for mileage, enter the associated number of miles.

### **Charge Amnt**

The charge can be calculated automatically or can be entered manually here. The charge is calculated automatically using one of the following:

- The percentage mark-up for expenses as set up in job type.
- The mileage chart rate if entering mileage expenses.

Automatic calculations can be overridden.

You can record a charge amount against a reviewable transaction. This will be used as the calculated value in the Chargeable Transaction Review option.

*Note: You must enter a charge amount if the cost currency differs from the income currency for that job number. The application does not use the mark-up percentage to automatically calculate recharge values for invoices or chargeable reviews in such circumstances.*

## VAT

On pressing **Enter** on a net amount or mileage, the VAT defaults to the VAT rate code on the expense type for expenses as set up in the job type. This VAT can be overridden for another valid VAT code.

### VAT Amnt

This column displays the amount of VAT charged against the line. If the VAT amount is blank the system calculates the VAT using the VAT code entered. This VAT amount can be overridden.

When you have entered all the details, press **F8**. You will be taken back to the employee entry screen, where you can select another employee and continue entering details. You can also review and amend the batch (**F15**), or cancel the batch (**F23**).

If you wish to end the batch, press **F8** again and you will see the Employee Expense Entry Screen for the batch end.

## Employee Expense Entry Screen

This screen displays the control value entered on the batch header screen and the accumulated totals from the individual employee expense claims. If the totals disagree, then the difference is highlighted in the discrepancy field. The original control total can be overridden to make the totals agree.

|                                                              |                                  |               |                           |

| Correct control total or press F key to correct transactions |                                  |               |                           |
| F10=Enter more items F15=Review batch F23=Cancel batch       |                                  |               |                           |
| 07-33                                                        | SE                               | MW            | KS IM II KENB20A PET149S2 |

### Fields:

#### Control Total

This field displays the control value entered on the batch header screen. If the value displayed in the 'Discrepancy' field is not zero, you can:

- alter the control total to match the accumulated total
- re-enter the batch to amend or add entries.

The control total field is a hash total, and is not concerned with multi-currency calculations. If, for example, you have entered 1000 dollars and 530,000 francs, then the control value is 531,000.

#### Accumulated

This field displays the value actually entered in the batch.

#### Discrepancy

This field displays any discrepancy between the accumulated and control totals.

This field must be zero before the **F8** key is made available for you to update the batch.

### Functions:

#### F8

Update the batch.

**F10**

Enables more employee details to be added to the batch.

**F15**

Enables you to cancel the batch.

**F23**

Pressed twice cancels the batch and all entries are lost.

Press **F8** to submit a job to update. Two reports are then generated, the Job Management posting validation report and the interface file validation (GL report).

# Timesheet Reconciliation

## 4/JCA

The system will not automatically post timesheet data to Job Management.

You can print a timesheet reconciliation report before transaction values are posted to the General Ledger. Timesheet Reconciliation prints details on employees who have not been through the batch, or who have worked fewer than their normal weekly working hours.

You can then amend any timesheets found to be in error. Amendments to timesheets can be made until they are posted to Job Management and GL.

This is a simple batch job, with no parameters required.

Take the Timesheet Reconciliation option to enter this option.

## Post Timesheets

### 5/JCA

You do not have to run Timesheet Reconciliation before the timesheets are posted to the relevant account.

The system updates the timesheet transactions in batch.

Once satisfied that all timesheets for a period are correct, Post Timesheets updates the Job Management files with a posting validation report and the GL files with an interface file validation report.

This is a simple batch job, with no parameters required.

Take the Post Timesheets option to enter this option.

*producing a report of the released values and  
any relevant information.*

The actual transfer of costs and/or income does not occur in this option. The data is prepared so that it is ready for transfer. The actual transfer takes place within the Transfer from WIP options.

The next screen displayed depends on whether the job is fixed price or not, and whether you choose to list transactions.

## Release Jobs Screen 2 (Fixed Price)

The screen displayed for releasing fixed price jobs depends on whether you have chosen in the release/reinstate job option to list transactions or not.

### List Transactions

This screen enables you to release selected costs and income from WIP. If the job type for the job has been set up with a flag for income deferred, then all postings to the P&L accounts for this fixed priced job number must be entered from this option.

It is anticipated that with certain stage payments, you may wish to spread the income/cost across a number of periods for accounting purposes. The release amounts are entered by you. The outstanding release value remains maintainable until the payment has been fully released.

Types are either income or cost.

## Release Jobs Screen 2 (Time And Material/Non Chargeable Jobs)

If you are releasing time & material type jobs or non-chargeable jobs, then the screen displayed will depend on whether you have decided to list transactions or not.

### List Transactions

If you choose to list transactions for all time & material or non-chargeable jobs, then the screen displayed lists transactions.

Transactions which have been set as rechargeable cannot be released until the invoices have been generated and printed. Cost transactions which are not rechargeable are available to this screen for release to the Profit and Loss accounts once the costs have been validated.

Unlike fixed priced jobs, time and material jobs cannot be released in stages.

13-33  SP  MK  KS  IM  II  KENB20A  PET149S2
  
```

*Note: The numbers 1 to 3 down the left hand side of the screen refer to the transfer methods 1 to 3.*

## Fields:

### Periodic Transfer

1 - Transfer all costs for all jobs with a transfer method of 1 from WIP to P&L.

### Transfer On Request

1 - Transfer all released costs and/or income for all jobs with a transfer method of 2 from WIP to P&L.

### Transfer On Completion

1 - Transfer all released costs and/or income for all closed jobs with a transfer method of 3 from WIP to P&L.

Select **F8=Confirm Request** to submit the job.

# Maintain Standing Costs

## 11/JCA

Standing costs can be used for journal entry, or as a fast track process for allocating costs that would otherwise be entered as direct transactions.

The purpose of standing costs is to enable you to simplify the posting of costs against a job number, where the cost is 'regular'. For example, you could set up rent of machinery as a standard cost with a fixed expense type, transaction type, currency details and charge code.

Instead of entering these details via Direct Transactions, you can set up a standing reference and enter the amount. Each standing reference has an associated set of job numbers.

Standing costs can be set up as reversible by setting a flag. Amounts initially posted as reversible await reversing out at a later date.

Take the Maintain Standing Costs option to see the first Maintain Standing Costs Screen.

# Maintain Standing Costs Screen 1

## Fields:

### Line

Enter the line number to be changed or deleted.

If you are entering a new reference then leave this field blank. The line number is allocated automatically by the application as new costs are added.

### Standing Ref

Enter a unique reference.

### Desc

A 35 character description field is available to describe a line.

### Reverse

If this is a cost that is to be reversed at a later date then set the flag to 1.

### Example

A report is to be run relating to costs incurred to date, and certain details are still awaiting entry (i.e. a disputed invoice not yet processed). You can enter these costs here, run the report, and reverse the costs back out when the actual cost is due for processing. For the purpose of the report, entering the cost as a standing cost may have made the report more timely and accurate.

### Curr

The cost currency of the transaction generated for this reference.

### Rate Code

The rate code to be used for currency conversion.

### Expense Type

The expense type of the cost.

This is the expense type to be used for all transactions generated for this reference, and must be a valid expense type. You are restricted to a valid expense type for the associated job type. Check the Expense Types option for the expense types associated with a job.

The expense cannot be employee related. This means that the expense type uniquely attributed to timesheet and employee expenses transactions cannot be used.

### Transaction Type

The transaction type for all transactions generated for this reference.

### Charge Code

The charge code for all transactions generated for this reference.

Each standing cost reference can have a number of job numbers attached to it. Enter a reference line number and press **Enter**. The other details are available for amending. If you make an amendment and press **Enter**, you will be taken to the second Maintain Standing Costs Screen.

### Fields:

#### Line

Enter the line number to be maintained or deleted. Each line relates to a job number. If you are adding a job number to this standing cost, then, leave this field blank. The line number will be automatically allocated.

#### Job/Sub-Job/Task

Enter a valid job number to be maintained. If you wish to enter a new job number to the standing cost, key in the valid job number.

The maintenance of standing cost details on this screen is based on the job numbers (job/sub-job/task) which relate to a standard cost reference already set up.

Each standing cost can have a number of job numbers set against it. For example, if you have a standing cost reference set up for the purpose of general rent payments, then you could set up the standing cost so that you could apportion the rent across different job numbers within a job header. In effect, any job number using the **F4** prompt key can have a line number attributed to it.

The actual amounts are not set to any default amount. The amounts are entered individually and periodically against a particular line number.

A reference may not be deleted where reversible costs exist for a reference.

### Functions:

#### F11

Delete Whole Reference. The delete function deletes the whole standing cost reference rather than just a line.

You must press **F8=Accept** to update any changes.

# Post Standing Costs

1...  
2...

## 12/JCA

It is likely that you will wish to enter standing costs periodically against one or more jobs. This is the first screen which enables you to post a standing cost. Only one standing cost reference can be entered at a time.

Take the Post Standing Costs option to see the Post Standing Costs Screen.

```

## Fields:

### Option

To post a standing cost, enter 1 against a line and press **Enter**. You can then enter cost values against job numbers.

### Last Posted

The 'last posted' currency date is the date at which a standing cost was last posted for that reference. This is a display-only field.

### Post Period

The posting period defaults to that of the GL posting period.

### Doc Date

The document date defaults to the present system date.

Select a line and press **Enter** to display the second Post Standing Costs Screen which enables you to post the actual amounts against the job details.

### Fields:

#### Value

Enter the posting value, or leave blank if no posting is to be made.

#### Control Value

This must equal the total of the postings entered.

Press **F8=Accept** to update.

# Reverse Standing Costs

1...  
2...

## 13/JCA

This option enables Job Management to reverse out previously posted standing costs.

Take the Reverse Standing Costs option. The option shows any costs that have been already posted and have been set as reversible.

Any reversible costs which have been posted back out are displayed on the Reverse Standing Costs Screen, but are not maintainable. You cannot access the line using the 1 (Select) column.

### Fields:

1

1 - Select the reference to be reversed.

Press **F8** to reverse the cost.

# Update Commitments

## 21/JCA

Within Job Management commitments are defined and processed as follows:

### **Purchasing**

Within purchasing, a commitment is:

- The value of purchase orders printed.
- The value of purchase lines not matched to a supplier invoice.

*Note: If SOP is not linked to Job Management, then all purchase orders are commitments. If it is linked, then stocked orders (order class 1 - 4) are not commitments. This is to avoid a double posting, i.e. from both Purchase Management and Inventory Management.*

### **Purchased Inventory**

Here, a commitment is:

- The value of outstanding items (these do not have to be allocated to be a commitment). The value is taken in accordance with the inventory costing method for that item.

### **Production Item within Inventory**

Here, a commitment is:

- The value of outstanding items (these do not have to be allocated to be a commitment). The value is taken from Production costs, using the cost set specified in the Job Management company profile.

The updating of committed costs takes place in batch. Take the Update Commitments option.

This option is a simple batch job, and no parameters are required.
