Chapter 8

Housekeeping

Day End Routines

1/SSH

Use this option to perform daily housekeeping procedures on your database. It is important to run it at approximately the same time every day to make sure that you maintain data integrity.

Note: This procedure requires exclusive use of the system.

This option performs the following jobs:

- It updates the database with any serial numbers entered during the day.
- It performs the contract updating for all contracts for the company when run as part of the day end routine. The contract updating is performed only for contracts owned by the requesting service branch when run as an individual option.
- It prints the Name and Address Override Audit report for all jobs where the site address was overwritten during call logging.
- It rebuilds the engineer work points values.

Reports Produced

- Contract Housekeeping Error Report.
- Contracts Awaiting Edit & Acceptance of Credits/Re-Invoices.
- Name & Address Override Audit.

Period End Routines

2/SSH

Use this option to make sure the calendar is kept in line with the period end dates defined for the company, and that the schedule of regular planned service visits, for long-term or never-ending contracts, is extended at the appropriate time.

You should run this option at the end of each service period, after running the Day End Routine option.

The month-end procedures include:

- Advancing the current service period
 - If the current (system) date is equal to a period end date, the current service period is updated to be the next period
 - If the current (system) date is not equal to a period end date, the current service period is updated to be the current period.
- Extending planned service visits for contract equipment to a further period.

Note: This procedure requires exclusive use of the system.

Note: The accounting period end is not affected by this routine. Update the accounting period by manually changing the field in Company Profile Maintenance.

The option extends the schedule of planned service visits for contract equipment as follows:

- Contract equipment with a Start Next Profile Load From period less than or equal to the current service period (plus the Minimum Number Of Loaded Service Periods from the company profile), is selected for processing. Equipment with a Start Next Profile Load From period set to 9999 will never be selected for processing.
- The scheduled visit profile, used to extend the schedule for a piece of equipment, is derived from either the contract header, the model, the model group, or the company profile. The option uses the profile found at the first of these levels and generates visits for the appropriate service periods. If no profile is found at any level for a piece of equipment, no extension to its scheduled visits can be made.
- The limits (start and end periods) for the extension are derived as follows:
 - Start period - This is the Start Next Profile Load From period, if this is not zero. Otherwise, the service period of the contract start date, or the equipment inclusion date, whichever is the earlier, is used.
 - End period - This is the service period of the contract termination date, or equipment removal date, whichever is the earlier. If the contract is a never-ending one, the end period is the start period plus

the number of service periods to be loaded (from the company profile).

- For each relative period on the visit profile, the actual service period is calculated as the start period plus the relative period. If this actual period is less than or equal to the end period, a scheduled visit record will be created. Once the end period is reached, the processing stops.
- Each piece of contract equipment processed is reported on an audit report, which shows the number of scheduled visits created and the corresponding period range.

Reports Produced

Extend Scheduled Visits Audit Report.

Once period end has completed successfully, you must take the option to Load Planned Maintenance Jobs, to convert the extended visits to actual jobs.

Engineer Work Points

10/SSH

Use this option to recalculate and update the work points total for each engineer in the company.

The update is included as part of the Day End Routine, but if the work point values need to be accurately maintained, it can be run more frequently using this option.

Note: This procedure requires exclusive use of the system.

The option reads through all the outstanding job lines assigned to an engineer (that is, all job lines with a status other than complete or cancelled), calculates and accumulates the work point values of the job lines, and updates the engineer details. This is repeated for all engineers within the company.

The work point value of a job line is calculated by multiplying the points value associated with the piece of equipment by the average hours factor associated with the job category.

Implications

The work point values are used when the module automatically assigns engineers to new service jobs.

If two or more engineers are equally qualified to do the job (based on the engineer/territory assignment rules), the one with the lowest number of work points is chosen, to spread the workload as evenly as possible.

Message Deletion

1... **2...** 11/SSH

Use this option to remove engineer or machine messages, or both, from the system, up to a selected expiry date. It should be used every six months or so.

You can also use this option to report on deleted messages which were never accessed and displayed.

Implications

You can remove messages superseded by events or with expiry dates far into the future from the system in a controlled manner.

Reports are available on engineers and on machine messages never accessed and displayed from the time of their origination.

SS912P	Z1 - UK Demonstration Company	USER GBJBALTW	21/05/98
	CENTRAL BRANCH		11:22:27
Message Deletion			
Delete engineer messages (0/1).... @ (0=No, 1=Yes)			
Delete machine messages (0/1)..... @ (0=No, 1=Yes)			
Delete messages with expiry date up to 21/05/98			
Report deleted messages never displayed (0/1).... @ (0=No, 1=Yes)			
F3=Exit F8=Submit			
HA a			08/045

Select **F8=Submit** to process the batch job.

Serious Error Report

1... 12/SSH **2...**

Use this option to print any serious errors logged since the previous printing of this report. You should undertake specific corrective action for any errors reported.

The report is user configurable, so you can choose the kinds of error you wish to include in it.

So far, only one serious error condition has been defined in Service Management. This is when the daily calendar has not been set up far enough ahead to be able to handle the generation of service contract visits up to five or 10 years ahead.

You can choose whether you want to simply print the report, or whether you want to clear down the serious errors file, or whether you wish to do both.

The report is for the whole company, not just for a branch.

Implications

Once the report has been printed, the errors included in it cannot be printed again by using this print option, but the errors are retained on the file.

Positive action must be taken to correct the errors. This may include updating and extending main data files; it may also entail correcting transaction records adversely affected by the data file deficiencies.

If the parameter to clear the serious error file is set to 1-Yes, all records on the file will be deleted; there is no in-built archiving process.
