Glossary

Glossary

Audit Files

These provide a log of all changes made to the contract header and items file.

Authority

The permission given by the customer to the supplier to manufacture the required items, or to buy materials for manufacturing. This is usually expressed in time or quantity.

Auto Release

This turns selected schedules into purchase orders.

Call Off

The quantity required by a customer for a specific delivery.

Consignment

All items being despatched to a customer in one delivery.

Contract Exception

A contract which is about to expire or reach limits.

Contract Restrictions

These are restrictions on minimum and maximum order values between effective dates.

Cumulative

The total quantity of a scheduled item despatched so far i.e. **cumulative despatched**, plus the outstanding requirements.

Delivery Requirement

The quantity required by the customer for a specific delivery. See **Call Off**.

Effective Quantity

The total quantity required by the customer over the life of the schedule.

FAB

This is Fabrication

History

Previous issues of the schedule.

Individual Requirement Percentage

This is a multi sourcing algorithm which splits the individual purchase requirement across multiple vendors according to pre-defined splitting rules.

Issue

A new version of the schedule. A schedule is usually a dynamic entity and is subject to regular amendment by the customer. The amendments are issued as a new version of the schedule.

Least Cost

This is a multi sourcing algorithm and searches the available price / quantity information to determine the lowest priced supplier for a given quantity.

Minimum Quantity

This is the minimum quantity the vendor will accept on any individual requirement.

Multi Sourcing

This allows for the setting up of rules for ordering high volumes from more than one vendor. For each item a sourcing table is set up which is used to calculate vendor and quantity for any supply requirements.

Overall Percentage

This is a multi sourcing algorithm and defines the sources of supply and the relevant percentage that each source is expected to supply.

P/O

This is a Purchase Order.

Quantity Price Break

This allows you to enter different prices for different quantities. The quantity price break is the amount up to which a price will apply.

Retrospective Invoicing

The ability to impose historical price increases, or reductions, on to a customer.

Round to Minimum

If this flag is active , if the quantity allocated does not reach the minimum quantity, then the system will round up the quantity to the minimum amount.

Round to Multiple

If this is active, the system will round the amount allocated up to a whole number multiple of this amount.

If no rounding has occurred to the amount originally allocated, the system will round the quantity up to the next multiple of the purchase unit of measurement.

Schedule

A statement of delivery requirements over a set period of time.

Schedule Purge

Removing old schedules to keep your system tidy.

Splitting Rules

For each vendor defined as a source of supply for an item, the following rules can, optionally, be defined.

percentage split

maximum quantity

minimum quantity

round up to a minimum quantity

round up to a multiple quantity

These rules work for all purchase requirements.

Status

The 'firmness' of a delivery requirement.

Time Buckets

Units of time used within the system, e.g. days, weeks, periods.

UoM

Unit of Measurement.

Vendor Splitting Rules

These show how suggested requirements are allocated across multiple contracts for the same vendor.
