Glossary

Glossary

Access Point

A point of reference in the dimension of key element being defined. For example there is an access point between aisles A and B.

Action List

A list of instructions to perform a number of warehouse moves including picks, put-aways and transfers.

Area

A defined part of a warehouse that corresponds to a section of the Location Code. The Area has a two-character code.

Area Dimension

There can be up to four elements to a Location Code. Each element is called an Area Dimension.

Area Rules

See Rules.

Check Digits

You can use Check Digits or Return Codes within the application to make sure that warehouse staff have visited the defined location. You enter a pair of characters, displayed on the location, to confirm an action. Check Digits are user-defined.

Committing

Sales Order Processing, Invoicing and Production Control allocate stock against the four wall inventory for the warehouse. When you have made the picking decisions, the inventory at a location is committed.

Committing Sequence

You can commit inventory by sorting the despatch documents by journey, customer, order or despatch note. This determines the quantity to be picked in one pick and may, therefore, determine where it is picked from.

Like items within the commit sequence are consolidated to give a single quantity to be presented to the commit process.

Continuous Processing Programs

A number of programs that are run continuously in order to monitor action taken in one part of the application that cause a re-action in another part. Monitoring receipts to Inventory Management in order to make put away decisions is a typical example.

Datum Location

The start point or reference location for the execution of an Area or Item Rule - see Rules.

Dimension Code

An area is defined by a number of dimensions, for example aisle, level and column. Each value in a dimension is a dimension code, for example, aisle C.

Fixed Location

Although, most you may store items randomly within a warehouse, it is possible to define a single or a number of nominated locations to house the item.

Handheld Terminals

Also called PDTs (portable data terminals), a small hand-held device to which a small batch of instructions can be down-loaded from a computer equipped with a Bar Code reader for confirming action.

IN Currency

A European currency that is linked to the EURO currency with a fixed exchange rate.

Instruction Documents

See Action List.

Item Profile

Information that defines how the item will be put away, stocked, moved and picked in the warehouse.

Item Rules

See Rules.

Label

When you receive stock, you can set up Warehousing to print labels for each pack to identify the item, lot number, quantity and dates. Labels can be assigned to a unique reference such that each pack is assigned a unique label.

Location Type

Locations may be classified so that fit calculations may be performed.

Lot Numbers

An item may be defined as being controlled as a lot number.

Marshalling

A nominated location, normally set up solely for this purpose, which contains all items where pick has been confirmed, but despatch has not yet taken place. This is a special location not subject to the constraints of standard locations.

Minimise Lots

When Warehousing decides which locations are to be used to pick from, if the item is lot controlled, Warehousing can be made to consume all of the first selected lot, wherever it is in the warehouse, before selecting the next lot.

Modulus 23

This is a method of generating Check Digits from a number by dividing it by 23 and then using the remainder to select a letter from the alphabet, (omitting O, V and I).

Movement Programming

The method by which the locations to be tested are established in an Item Rule - see Rules.

Pack Types of Package Types

Items may be moved in standard outer packs such as pallets, tatepans, bundles. These can be defined to Warehousing.

Pick Location

A fixed location for a normally fast moving item from which the majority of picking takes place. You can choose to automatically replenishment this location using the Warehousing option.

Proximity Rule

A particular type of Area Rule - see Rules.

Random Rule

A particular type of Area Rule - see Rules.

RDTs

Radio Data Terminals. These are either hand-held or truck mounted and allow continuous contact between an operator and Warehousing. This means that real-time processing is possible.

Reason Code

When a non-standard action is taken a reason must be given. It may be selected from a displayed list of Reason Codes.

Receiving

A nominated location, normally set up solely for this purpose, which contains all items received into Inventory and recommended for put-away, but confirm put-away has not yet taken place. This is a special location not subject to the constraints of standard locations.

Replacement or Replenishment Quantity

The quantity to be found and placed in the picking location to refill it.

Resources

Whenever a movement takes place in a warehouse it is achieved using some kind of agent or resource. These can be defined.

Rotation Date

The date that stock should be rotated. Stock may be rotated using the expiry date, the date of receipt to the warehouse or to the location.

Rules

When a recommendation is made by the application to put away into or pick from a location the decision is based upon one of a number of rules.

There are item rules and area rules. An item rule moves from a nominated location in a pre-defined pattern to test the neighbouring locations, while an area rule tests all the locations in an area or a defined part of an area, in a specified sequence. The sequences may be random, how close the location is to a defined search anchor point, or the frequency of use of locations.

Serious Error Monitoring

When Warehousing detects a non-standard action it logs the event. It can also direct a message to a nominated user or screen so that instant action may be taken by the supervisory function.

SKUs

Stock Keeping Unit or the unit of measure in which the item is accounted for and actioned in the warehouse.

Split Packs

Split packs are when an the item is stored in units of less than a complete pack. Separate rules can be set up to control this condition.
