Chapter 1

MPS/MRP Forecasting

MPS/MRP Forecasting Introduction

Note: This describes the MPS facility in detail, but all functions and definitions apply equally well to MRP.

Not every organisation is interested in being driven by forecasts and the use of forecasts is not mandatory. If forecasts are used as an input of external, independent demands, the following alternatives exist:

- Create item level sales/stock forecasts within the MPS and MRP applications themselves.
- Create sales forecasts using the Forecasting application and subsequently transfer them to MPS and MRP, using standard menu option transfer facilities for doing so. The distinction between Forecasting developed forecasts and those developed within MPS and MRP is that the former forecasts are based upon an extrapolation of historical sales experience. MPS and MRP forecasts are generated at item level as percentages of user-defined group level forecasts.
- Extract customer schedules from the Scheduled Orders (SH) application and build aggregated item forecasts from them.

This section of the product information is concerned with the first of these alternatives.

Both MPS and MRP include complementary forecasting facilities.

Items to be included in product family forecasting must have an item group minor analysis code detailed in Inventory. Such forecasting can be, either

- Gross family level forecasts - i.e. forecasting by groups of parents or
- Discrete item forecasts - i.e. forecasting by individual parents.

The benefit of using family level forecasts is that they are likely to be more accurate than individual item forecasts and there is less detailed input required.

Product Families

This is the first step in establishing a product group forecast. A product family is any group of items which have the same item group minor code set in their item master file records.

For example:

- Item Group Minor = Domestic appliances, which include: Washing machines, Freezers, Dryers, Dishwashers, Vacuum cleaners

Or

- Item Group Minor = Washing machines, which include: Electronic, Deluxe, Standard

The item range within your organisation must be examined to establish the most appropriate level for your Item group minor code.

Each item within the product family is given a percentage factor, which is used to determine the quantity of each to be produced. (This factor may be zero for a particular item within a family.)

By establishing item group minor codes for every item, it is possible to specify individual forecasts for each item.

Maintain Product Family

1/MPF

Select Maintain Product Family on the menu to display the first Maintain Product Family screen.

Maintain Product Family Screen 1

Note: An MPS reporting profile must be created before product families can be set up.

This screen lists all the Item group minor codes defined to Inventory Management, under the heading product family. If a forecast profile already exists for a particular product family, a Y is displayed in the Profile column.

Select Maintain Product Family on the menu to display the first Maintain Product Family screen.

Fields:

Model

Enter a planning model.

Press **Enter** on the first Maintain Product Family screen to display the second screen.

Maintain Product Family Screen 2

Press **Enter** on the first Maintain Product Family screen to display the second screen.

06-04 SF MK KS IM II KENB20A PET166S2

Fields:

O

Option. To select a particular product family, place a 1 against the relevant line. The third Maintain Product Family screen is displayed.

Note: When planning for process groups the forecast MUST be for the items actually sold (i.e. each co-product) and not the process group itself. This means that the product group minor codes should be entered on the co-product in Inventory Details.

Enter 1 in the O field on the second Maintain Product Family screen to display the third screen.

Maintain Product Family Screen 3

Enter 1 in the O field on the second Maintain Product Family screen to display the third screen.

All items currently linked to this item group minor are displayed.

Fields:

Type

The source type, is displayed for each item.

MAN - For manufactured/produced

PHM - For phantom

PUR - For purchased

B/O - For bought out

TL - For consumable tool

RTL - For reusable tool

GAU - For gauge

MPS

If a particular item is Master Scheduled, this is shown by a 1 against the item, in this column. If this is the case, the forecast generated for the item is used in MPS to determine the demand for the item.

Percentage

For each item, enter the percentage of the group value to be represented by that item. This figure represents the estimated sales popularity of the item, or its relative production level, within the family.

*

If the demand policy does not include sales forecasts, i.e. it is either 0 or 3, an asterisk is displayed in this field.

Warning: The percentages must add up to 100%.

Press **Enter**; the system checks that the percentages add up to 100% and warns the user if it does not. When the values have been completed and equal 100, select **F8=Update** to update them.

Note: When you return to the previous screen, a Y is displayed against the family that has just been established.

Maintain Seasonal Indices

2/MPF

This function allows you to create season indices which can be used to spread the forecast over days, weeks or months (period) automatically.

Select Maintain Seasonal Indices on the menu to display the first Maintain Seasonal Indices screen.

Maintain Seasonal Indices Screen 1

Select Maintain Seasonal Indices on the menu to display the first Maintain Seasonal Indices screen.

Entry Level..... 2 1=Period 2=Weekly			
Base on Profile.?.. _			
F3=Exit F4=Prompt			
06-39 SF MW KS IM II KENB20A PET166S2			

Fields:

Model

Enter the MPS model for which you wish to enter or maintain a seasonal profile.

Profile Code

Enter the seasonal profile index that you wish to create or maintain. The profile code itself does not have to be unique; it is possible to have two profiles with the same code if the year and/or the model is different. **F4=Prompt** displays:

A list of valid profile/model/year combinations of all three fields left blank

A list of valid profiles, if the model and year are specified first

Year

Enter the year you are forecasting over. The model and year combination must exist on the calendar.

Entry Level

Indicates whether the profile is to be created on a period or weekly basis.

1 - Enter your forecasts over calendar periods. You may subsequently break the period forecast down into weeks within that period

2 - Enter the forecasts over weeks.

Base On Profile

If a new profile is being created, a base on profile may be entered, from which the details are copied. The model, year and entry levels of the new and existing profiles must match.

Note: Seasonal profiles are: Year specific - they must be created for each year; Model specific - they must be created for each model.

Press **Enter** on the first Maintain Seasonal Indices screen to display the second screen.

Maintain Seasonal Indices Screen 2

Press **Enter** on the first Maintain Seasonal Indices screen to display the second screen.

This screen displays the Daily indices at the top and a window containing either the Period indices OR the Weekly indices, depending on the choice of Entry level on the previous screen. The object of this facility is to create a distribution pattern which can be used to spread the production totals over the appropriate days, weeks and months of the planning horizon.

Description. Enter a suitable description for the profile.

Daily Indices

Enter daily indices as appropriate.

Index

Enter period indices as appropriate.

Functions:

F16

Move back to the period indices window.

F17

Weekly Indices. It is possible to display weekly periods (within months). This displays a second window.

F18

Display Distribution. To see the percentage distribution for the indices you have entered.

Maintain Family Sales Forecast

This is the second step in establishing a family group forecast. Having created the product family, you can now enter details of the weekly family forecast. Two types of family forecast can be set up:

Sales Forecasting

Sales forecasts are statements of anticipated market demand for a product. During the planning process these are compared with any existing sales orders, and then, in accordance with the demand policy for the item (this tells the system how to compare the forecast and sales orders), the net demand is determined.

Stock Forecasting

Stock forecasts are statements of the required build of products to meet customer service objectives and represent a hedge against demand uncertainty. They are not consumed by sales orders, and should be viewed as orders to replenish stock. The items produced to satisfy a stock forecast are intended to be used as hedging inventory, or as customer service inventory. This demand management technique should be used carefully to avoid excessive levels of inventory being built. It is provided as a means of buffering demand uncertainty in the marketplace.

Differences Between Sales And Stock Forecasting

As the sale and stock forecast maintenance facilities are very similar it is important to understand the following distinction:

- A sales forecast is a quantity of demand to be met within a length of time, whereas a stock forecast is a target level to be maintained during that time.

For example, a sales forecast representing a market demand of 3,000 spread evenly over three periods potentially leads to production of 1,000 in each period. A stock forecast intended to maintain a stock level of 3,000 for three periods shows the 3,000 target in each of the three periods.

Separate menu options are provided for Sales Forecasts and Stock Forecasts. Take care to select the correct option for your forecast!

11/MPF

Select Maintain Family Forecast on the Sales Forecast sub-menu to display the first Maintain Family Sales Forecast screen.

Maintain Family Sales Forecast Screen 1

Select Maintain Family Forecast on the Sales Forecast sub-menu to display the first Maintain Family Sales Forecast screen.

```

-----
F3=Exit  F4=Prompt

      06-42  SF  MW  KS  IM  II  KENB20A  PET166S2
  
```

Fields:

Model

Enter the model number.

Year

Forecasts are created by calendar year.

Product Family

Enter the product family code.

Forecast Basis

Normally this is by Quantity but could be by Value. A forecast expressed in value terms is converted to a forecast quantity by this process. A sales value forecast is divided by the base list price held on the Item Descriptions file. A stock value forecast is divided by the standard cost of the item in its primary stockroom.

Seasonal Profile

If previously set up.

Maintain Intervals

Enter 1 to be able to select which periods require a daily forecast and which require a weekly/period forecasts.

Include Backlog

Enter 1 to include outstanding sales orders due within the run dates of the last MPS run for the forecast model selected. The facility is not available for stock forecasts.

Press **Enter** on the first Maintain Family Sales Forecast screen to display the second screen.

Maintain Family Sales Forecast Screen 2

If the Maintain Intervals field on the selection parameters screen was set to 1 (yes) then this screen is displayed. You can enter the total forecast quantity and select daily, weekly and period week numbers.

If daily forecasts are selected for a range of week numbers then the forecast is spread daily over the weeks indicated irrespective of the seasonal profile setting.

Press **Enter** on the first Maintain Family Sales Forecast screen to display the second screen.

Note: The week numbers shown for the respective forecast intervals must be consistent and fall on period boundaries.

Model?.. _			
Year 95			
Item?.. _			
Forecast Basis 1 (1=Quantity 2=Value)			
Seasonal Profile..?.. _			
Maintain Intervals... _ (1=Yes)			
Include Backlog..... _ (1=Yes)			
F3=Exit F4=Prompt			
06-42 SF MK KS IM II KENB20A PET166S2			

Fields:

Model

Enter an MPS model for the forecast. If you intend to run MPS using this forecast, and then want to confirm any suggested supply, then the model you enter here must be the live model, as defined to the company profile.

Year

Enter the year you are forecasting over. The model and year combination must exist on the company calendar. The system defaults to the current year.

Item

Enter a valid item (if you are using the Maintain Item Forecast option). The item must exist and have a non-zero demand policy.

Forecast Basis

Normally this is by quantity but could be by value. A forecast expressed in value terms is converted to a forecast quantity by this process.

A sales value forecast is divided by the base list price held on the Item Descriptions file.

A stock value forecast is divided by the standard cost of the item in its primary stockroom.

1 - To forecast by quantity.

2 - To forecast by value.

Seasonal Profile

A seasonal profile is set up to act as a template when entering forecasts. If a profile code is entered, forecast values are apportioned automatically according to the rules defined for it.

This entry also determines the level to which the forecast can be maintained, in that if the seasonal profile has a weekly entry level, then the Maintain Intervals screen allows only daily and weekly interval selections.

If this field is left blank, then the values entered for the forecast are evenly spread, and any manipulation must be actioned manually.

If you enter an existing seasonal profile, the profile/year/model/calendar combination must already exist. Select **F4=Prompt** to display a choice.

If the profile/model/year fields are left blank, a window displays the valid profile/model/year combinations.

If the model and year are entered, then a window displays the valid seasonal profiles for selection.

Maintain Intervals

Enter 1 to spread the quantity/value over selected intervals. A separate screen enables you to specify the total forecast quantity or value you want to work with.

You then tell the system how to present the time buckets on the forecast screen, in daily, weekly and period buckets.

It is usual to select daily intervals for the earliest week or weeks in the forecast, weekly intervals for intermediate weeks, and periods for the longer term part of the forecast.

Period buckets are not allowed if the selected profile is weekly based, and does not use periods itself.

Include Backlog

Enter 1 to display the outstanding sales orders due within the run dates of the last MPS run for the forecast model selected.

Note: This field is not displayed when maintaining stock forecasts.

Press **Enter** on the first Maintain Item Sales Forecasts screen to display the second screen.

Maintain Item Sales Forecasts Screen 2

This screen displays the current item forecast which may be maintained.

Press **Enter** on the first Maintain Item Sales Forecasts screen to display the second screen.

Spread Item Sales Forecast

14/MPF

You can select one or more items for spreading according to the specified intervals. A default seasonal profile can be set on the Production Details screen. This can be changed on the next screen. The intervals must be adjoined to each other and at least one set of intervals must be entered.

Select Spread Item Forecast on the Sales Forecast sub-menu to display the first Spread Item Sales Forecast screen.

Spread Item Sales Forecast Screen 1

Select Spread Item Forecast on the Sales Forecast sub-menu to display the first Spread Item Sales Forecast screen.

Weekly Forecasts

Enter the week number range for which weekly forecasts are required.

Functions:

F15

Select All.

F18

Displays Values. Display values instead of quantities.

Maintain Family Stock Forecast

These menu options provide the same facility as the Sales Forecast options.

They are used to produce stock forecasts which are designed to build up or run down stocks to the end date of the planning horizon.

Build A Stock Forecast

These functions are similar to the Sales Forecast function.

However the Stock Target over Intervals figure represents the stock level to be achieved across the selected intervals.

If a seasonal profile is used then the highest index figure is used to assign the stock target total. It then assigns the other index values in proportion. If no seasonal profile is used then the stock target is entered in each period.

Build A Stock Profile

Note: This function is available only when taking the stock forecast option. It is not available on sales forecasts options.

This function is used to build a stock profile according to four parameters - from date, to date, target date, and target quantity/value. The from and to dates define the range over which the forecast is built., and the target quantity/value, the stock level which should be achieved on the target date. A stock forecast is then generated to meet the profile and all quantity/value figures for the forecast recalculated.

21/MPF

Select Maintain Family Forecast on the Stock Forecast sub-menu to display the first Maintain Family Stock Forecast screen.

Maintain Family Stock Forecast Screen 1

Select Maintain Family Forecast on the Stock Forecast sub-menu to display the first Maintain Family Stock Forecast screen.

Fields:

From Date

The date from which the stock profile is to be built.

To Date

The date to which the stock profile is built.

Target Date

The date at which the target stock level should be achieved.

Target Quantity

The stock level which should be achieved at the target date.

Press **Enter**. The start stock target figure is calculated for each period and is shown as cumulative figures (building up to the desired stock target).

Generate Item Stock Forecast

22/MPF

This is the same as Generate Item Sales Forecast, only for stock forecasts.

Select Generate Item Forecast on the Stock
Forecast sub-menu.

For more information see Generate Item Sales Forecast.

Maintain Item Stock Forecast

23/MPF

This is the same as Maintain Item Sales Forecast, only for stock forecasts.

Select Maintain Item Forecast on the Stock
Forecast sub-menu.

For more information see Maintain Item Sales Forecast.

Spread Item Stock Forecast

24/MPF

This is the same as Spread Item Sales Forecast, only for stock forecasts.

Select Spread Item Forecast on the Stock
Forecast sub-menu.

For more information see Spread Item Sales Forecast.

Extract Customer Schedules

Note: This option is only available for MPS forecasts.

This option accumulates for scheduled orders related to the selected MPS model's stockrooms, the quantities found for all items and all customers in the Scheduled Orders (SH) application; and builds MPS sales forecast records from them. Only scheduled orders relating to stockrooms associated with the MPS model entered on the parameters screen are selected.

The option is given to extract daily, weekly and period schedules in any combination. Where multiple schedules exist for the same item, quantities are accumulated.

Forecasts are always created at the most detailed level. That is, if a weekly and daily schedule overlap; then the overlap period creates daily forecasts only; (including equivalent daily quantities from the weekly schedule).

The use of the scheduled orders extraction to create forecast records has no effect on:

- The MPS run extraction of sales orders from the Order Entry database.
- The forecast consumption.
- The demand issues controlled by the item-specific demand policy codes.

Sales orders which have been loaded into the Order Entry database by Scheduled Orders are treated like any other sales order. They are extracted if related to one of the stockrooms associated with the model being run.

Warning: All existing sales forecasts for items found to have qualifying schedule orders lines are deleted and replaced with new sales forecasts. All scheduled order lines with a quantity remaining to be shipped, irrespective of status code, are extracted and accumulated in new sales forecasts if they meet the date range and MPS model stockroom tests.

31/MPF

Select Extract Customer Schedules on the menu to display the Extract Customer Schedules screen.
