Chapter 7

Forecast Management

Forecasting Within Style Production

The Forecast Management options within Style Production Definition Management are used by both MPS and MRP.

You can use:

- Product families. Group together related styles for forecasting and planning purposes.
- Seasonal profiles. Specify a series of relative demand quantities in contiguous periods. Subsequently, input a single forecast covering all of the periods within the date range. Style uses the seasonal profile to spread demand over the date range.
- Sales Forecasts. Represent an anticipated level of sales.
- Stock Forecasts. Represent a planned level of stock to be held.

Note: Not every production environment is interested in being driven by forecasts. Therefore, the use of forecasts is not mandatory.

To obtain better data for forecasting, use System 21 Forecasting. You can transfer a forecast from Forecasting to Style Production. Then, either manipulate the forecast within Style Production Forecasting or input the forecast to MPS and MRP.

Prerequisites

The forecasts that you create must relate to a specific planning model and year.

To set up a planning model, use the following two options:

Option:	Function:
Maintain Model Stockrooms:	Set up a planning model and specify the stockrooms to include.
Maintain Reporting Profile:	Set up time buckets for the planning model.

Product Families

A general forecast for a group of related styles can be more accurate than individual forecasts. To this end, you can group related styles into product families.

Examples of product families are:

- Jackets:
 - Anoraks.
 - Ski coats.
 - Duffel coats.
- Trousers:
 - Denim.
 - Corduroy.
 - Cotton.
 - Polyester/cotton.

To use product families, follow the procedure below:

1. Use the Descriptions option in Style Inventory Management to establish product family codes against type PGMN.
2. For each style that you wish to include in a product family, enter a product family in the Prod Group Minor field on Product Maintenance Screen 4 under the Style/Material Details option.
3. For each style, enter a relevant forecast demand policy in the Demand Policy field on the Production Details Screen under the Style/Material Details option:
 - 1 (forecast compared with independent demand).
 - 2 (forecast compared with total demand).
 - 5 (make to forecast).
 - 6 (total demand).
4. For each style, enter a forecast level policy in the Forecast Level field on the Production Details Screen under the Style/Material Details option. To enter forecasts at style level which Style can explode down to variant level, enter 0 in this field. Otherwise, you can enter 1 or 2 to enter forecasts for each style variant.
5. Use the Maintain Product Family option to define a percentage distribution of forecast for each style in the product family for a particular planning model. Depending upon the setting of the Forecast Level field for each style, this option creates forecasts at style level or style variant level.

Note: Style does not generate a forecast for a product family as an entity in its own right. That is, a forecast of 50,000 against product family

ELF generates individual member forecasts that total 50,000. How this 50,000 is distributed depends upon the percentages set for each style or style variant.

For example:

Product Family Forecasting Data		
Product Family: ELF		
Total Forecast: 100,000		
Member	%	Generated Forecast
ELF Pumps	20	20,000
ELF Shoes	20	20,000
ELF Boots	60	60,000
	100	

Sales And Stock Forecasts

Forecasts can be either sales projections or stock production forecasts that establish the level of stock that you wish to maintain to service your market demand.

Sales and stock forecasts differ:

Type of forecast	Definition	Sample Scenario	Solution
Sales forecast	A demand that must be met within a period of time.	A sales forecast for 3,000 spread evenly over 3 periods.	Produce 1,000 in each period
Stock forecast.	A target level to be maintained during a period of time.	A stock forecast for 3,000 spread evenly over 3 periods.	Maintain 3,000 in each period

You can either generate sales and stock forecasts for quantities or enter a value within a period. Values are converted to quantities for planning purposes by dividing the value entered by either the base list price for sales items, or standard unit cost for stock forecasting.

Note: To determine the start and end dates for a forecast, Style uses the start date from the default production calendar and the days defined on Maintain Company Profile screen 7 under the Maintain Company Profile option. Therefore, for a 53 week forecast year, the days must total 371 on Maintain Company Profile screen 7.

Sales Forecasts

If a style's Demand Policy includes forecasting, Style Production Planning compares sales forecasts with existing sales orders to determine a net demand.

Stock Forecasts

Stock forecasts are not netted against sales orders in the planning process and should be viewed as orders to replenish stock.

Warning: To avoid excessive levels of inventory being built, use stock forecasts carefully. Treat stock forecasts as a means of buffering demand uncertainty in the market place.

Forecast Method

You can generate forecasts at daily, weekly and period level, where a period is any period of time longer than a week.

There are three basic ways of approaching forecasting.

Method 1

1. Use the Maintain Family Forecast option to create forecasts at product family level, apportioning quantities or values across time periods.
2. Use the Generate Style Forecast option to generate a style forecast for each product family member.
3. Use the Generate Style Forecast option to manipulate the forecast at product family level.

Method 2

1. Use the Maintain Family Forecast option to create forecasts at product family level, apportioning quantities or values across time periods.
2. Use the Generate Style Forecast option to generate a style forecast for each product family member. Initially, manipulation is at product family level, but individual forecasts for each style are then generated.
3. Use the Spread Style Forecast option to spread the forecast to daily and weekly level by style.

Method 3

1. Use the Maintain Style Forecast option to create and manipulate forecasts specifically at style or style variant level.
2. If you have entered forecasts at style level, use the Generate Variant Forecast option to explode forecasts down to style variant level.

Note: At whatever level you enter a forecast, you can use the Generate Variant Forecast option to explode forecasts down to each style variant.

Note: Even if you do not explode forecasts down to style variant level, Style Production Planning will generate a variant level forecast.

Indices

Each forecast quantity or value must be spread over a number of daily, weekly or longer periods.

You can enter forecasts for these individual periods of time in the following ways:

- Manually.
- Period-by-period.
- By entering a series of indices against each period which spreads the forecast automatically according to the index values.

For example:

Spread Forecast Using Indices											
Forecast Total Quantity 100											
Index Total 200											
Indices	10	20	10	20	10	10	10	10	30	30	40
	Days					Weeks			Periods		
Generated Forecast	5	10	5	10	5	5	5	5	15	15	20

Smoothing Policy

When you use weekly forecast figures in a forecast, Style Production Planning assumes that you wish to generate the demand on the Monday of that week.

You can set the Smoothing Policy field on the Production Details screen under the Style/Material Details option to spread a weekly forecast evenly over each working day in a week.

Warning: Take care over smoothing the forecast over a long period of time, as a considerable amount of additional data has to be stored. In general, use the smoothing option and the ability to generate daily forecasts for short term forecasts, that is for a maximum period of 2-3 months.

Maintain Product Family

1/P1F

To display Maintain Product Family screen 1,
select Maintain Product Family from the menu.

Use this option to define percentages for each style or style variant in a particular product family. Enter percentages to reflect the relative market popularity or production volume of each style.

Styles uses these percentages to apportion the forecast total across the members of a product family.

*Note: You can set a zero percentage for a style
or style variant.*

Prerequisite

To add a style to a product family, enter the product family in the Prod Group Minor field on Product Maintenance Screen 4 under the Style/Material Details option.

Maintain Product Family Screen

-  To display this screen, select Maintain Product Family from the menu.

Use this screen to enter the model for the required plant or line, as set up

Fields:

Model

Enter one of the planning models set up under the Organisational Model option.

-  Press **Enter** on Maintain Product Family screen 1 to display Maintain Product Family screen 2.

Maintain Product Family Screen 2

Use this screen to select the product family for which you wish to enter percentages for forecasting. To look up a list of product families, refer to the PGMN code under the Descriptions option in the Style Inventory module.

Product families are allocated to individual styles in the Prod Group Minor field under the Style/Material Details option.

Press **Enter** on Maintain Product Family screen 1 to display Maintain Product Family screen 2.

Fields:

Type

This field displays for your information only. The field indicates the setting of the Item Type field under the Style/Material Details option. The Type field has the following values:

MAN - A manufactured product.

PUR - A purchased item.

B/O - A bought out item.

MPS

This field displays for your information only. The field indicates the setting of the Planning Type field and has the following values:

0 - Material Planning (MRP) item.

1 - Production Scheduling (MPS) item.

Percentage

To explode the forecast down to the Forecast Level for a particular style, enter a percentage against the style or selected variants.

The total percentage must equal 100%.

Maintain Seasonal Indices

2/P1F

To display Maintain Seasonal Indices screen 1,
select Maintain Seasonal Indices from the menu.

Use this option to create and maintain a seasonal profile. Use seasonal profiles as templates to break down forecasts to period, weekly and daily levels.

A seasonal profile holds a range of indices against daily, weekly or period buckets. You can apply a seasonal profile to any product family or style

Whilst not mandatory, this option allows you to represent seasonal variations in the forecast. You can also use a seasonal profile to define a default forecast profile not subject to seasonal variation.

Seasonal profiles speed up forecasts. All you need enter is the forecast total against a style and Style spreads the forecast according to the defined seasonal profile.

Seasonal profiles also allow you to enter period level forecasts on Maintain Family Sales Forecast screen 2 (Maintain Family Forecast option) and Maintain Styles Sales Forecast screen 2 (Maintain Style Forecast option).

To assign a seasonal profile to a style, enter the Profile Code in the Seasonal Profile field in Production Details under the Style/Material Details option.

Tip: Seasonal profiles are specific to a particular year and planning model. Therefore, create one seasonal profile for each model that you wish to include within each year.

Maintain Seasonal Indices screen 1

To display this screen, select Maintain Seasonal Indices from the menu.

Use this screen to specify the seasonal profile you wish to create or update.

```

      Base on Profile.?..  _

F3=Exit  F4=Prompt

06-39  S2  MW  KS  IM  II  KENB20A  PET166S2
  
```

Fields:

Model

Enter the planning model in which the seasonal profile is valid.

Profile Code

Enter a maximum 2 character code to create or maintain.

Note: The profile code itself does not have to be unique; it is possible to have additional profiles with the same code if the associated model and/or year is different.

Year

Enter the year for which the profile is relevant. This field defaults to the current year.

Entry Level

Enter one of the following:

1 - Period. Displays Maintain Seasonal Indices screen 2, from which you can define the profile according to period. Subsequently, you may break the profile down to weekly.

2 - Weekly. Displays Maintain Seasonal Indices screen 3, from which you can define a weekly profile.

Note: You can enter daily indices for both period and weekly profiles.

Base On Profile

If you are creating a new profile based on an existing profile code, enter the existing profile code here.

Note: The model, year and entry level of the new profile code must match the model, year and entry level of the existing profile code.

Maintain Seasonal Indices screen 2 (Option 1)

To display this screen, enter 1 in the Entry Level field on Maintain Seasonal Indices screen 1.

Use this screen to break down forecasts to periods. Enter relative values, which Style can use to work out the percentages, rather than absolute values.

From this screen, you can refine the period profile down to weeks.

You can also enter indices for each day of the week.

Example 1

Take a profile covering 12 periods. If you enter 1 against periods 1-10 and leave periods 11-12 blank, then the resulting percentage distribution is 10% for periods 1-10, and 0% for periods 11 and 12.

Example 2

If the profile covers two periods and you enter indices of 1 and 2 against both periods, then the resulting percentage distribution is 33.3% and 66.6% respectively.

18-42  S  MW  KS  IM  II  KENB20A  PET166S2
  
```

Fields:

Model

Enter the planning model to which this forecast applies. If you are using the forecast to drive MPS and MRP, enter the live planning model.

Year

Enter the year to which the forecast relates.

Note: You should have already defined a production calendar for the year that you enter here for the calendar specified on the model's reporting profile.

Product Family

Enter a valid product family.

Forecast Basis

Enter one of the following:

- 1 - Quantity. Base the forecast on quantity.
- 2 - Value. Base the forecast on value.

Seasonal Profile

Enter a seasonal profile set up from the Maintain Seasonal Indices option (optional). This seasonal profile can act as a template when entering forecasts. Figures are automatically apportioned according to the rules defined by the seasonal profile.

By entering a seasonal profile, you also determine the level to which you can maintain the forecast:

- Weekly seasonal profile. You can enter daily and weekly intervals only on Maintain Family Sales Forecast screen 2.
- Period seasonal profile. You can enter daily, weekly and period intervals on Maintain Family Sales Forecast screen 2.

To spread values for the forecast evenly, leave this field blank. In this case, you must perform any manipulation manually.

Maintain Intervals

The option is given to define how to spread the forecast total, without entering each spread figure individually. Enter one of the following:

0 - No. Display Maintain Family Sales Forecast screen 3.

1 - Yes. Display Maintain Family Sales Forecast screen 2, from which you can specify the total forecast quantity or value and define how to spread the daily, weekly and period time buckets.

Include Backlog

The option is given to display the outstanding sales orders due within the run dates of the last planning run for the forecast model selected. Enter one of the following:

0 or blank - No.

1 - Yes.

Leave the Maintain Intervals field blank and press **Enter** on Maintain Family Sales Forecast screen 1 to display Maintain Family Sales Forecast screen 3.

Maintain Family Sales Forecast screen 2 (Option 1)

To display this screen, enter 1 in the Maintain Intervals field on Maintain Family Sales Forecast screen 1.

This screen allows you to spread a revised forecast over selected intervals, replacing any existing forecast values.

If a seasonal profile has been selected on the Parameters screen, the forecast will be broken down according to the indices defined on the profile. Otherwise, the forecast will be spread evenly over the existing forecast time intervals.

It is usual when spreading forecasts, to select daily intervals for the earliest week or weeks in the forecast, weekly intervals for intermediate weeks, and periods for the longer term part of the forecast.

Note: Period buckets will not be allowed if the selected seasonal profile is weekly based, and so does not include periods.

The Control Details section of the screen displays the last week for which a forecast has been set up, and where relevant, the daily and weekly forecast boundaries as generated by the last item batch spread.

Note: If a particular style forecast has been maintained interactively via the Maintain Style Forecast routine, then the control details displayed may not represent the current status of the forecast. If this is the case, then the forecast details should be examined separately.

The calendar structure, showing start and end weeks in each period, may be displayed for reference for forecasts which include details at period level.

Note: Period intervals will only be displayed if a period based seasonal profile was entered on the Parameters screen.

On completion of data entry, press **Enter** to continue.

Daily Forecasts from Week to Week
Weekly Forecasts from Week to Week

F3=Exit F12=Previous

16-31 SA MW KS CL IM DM II STUD140 KB PED201S1

Fields:

Calendar Code

This field is for your information only. The field displays the production calendar code held on the selected model's reporting profile.

Total Forecast

This field is for your information only. The field displays the existing total forecast quantity. The forecast value to be spread will be added to this if it is for a period not covered by the existing total.

Control Details

Daily Forecasts To Week

This field is for your information only. The field displays the week number up to which daily forecasts have been generated.

Weekly Forecasts To Week

This field is for your information only. The field displays the week number up to which weekly forecasts have been generated.

Last Week Of Forecast

This field is for your information only. The field displays the last week of the forecast that has a non zero balance. If this is a period forecast, the last week will be the end week of the period.

Spread Details

The forecast figure must be spread across a range of daily, weekly and period intervals. The intervals must be contiguous and for calculation purposes some intervals are limited to period start and end weeks.

For forecasts including period intervals, the production calendar can be displayed to reference period start and end weeks.

The selections previously made for this family, planning model and year will be the defaults displayed.

Forecast Quantity To Spread

This is the forecast quantity to be spread over the selected intervals. The figure will be broken down according to the seasonal profile selected, or if no profile has been entered, the figure will be spread evenly across all the intervals in the forecast period.

Daily Forecasts Range

Enter the number of weeks for which daily forecasts are required, in terms of start and stop weeks.

Weekly Forecasts Range

Enter the number of weeks for which weekly forecasts are required, in terms of start and stop weeks.

Period Forecasts Range

Enter the number of weeks for which period forecasts are required, in terms of start and stop weeks.

Functions:

F20

Display calendar structure; only displayed for forecasts with a seasonal profile.

Maintain Family Sales Forecast screen 3 (option 0)

To display this screen, press **Enter** from Maintain Family Sales Forecast screen 2.

To display this screen, enter 0 in the Maintain Intervals field or leave blank on Maintain Family Sales Forecast screen 1.

Use this screen to input a total forecast quantity, and to see the spreading effects of the forecasting indices which you have input.

The information displayed on initial entry is dependent on the conditions under which the screen was accessed:

- If maintaining an existing forecast, details will be as previously entered.
- If creating a forecast without having maintained intervals or specifying a seasonal profile, all data input fields will be blank and you will need to enter a total forecast figure and indices.
- If creating a forecast without having maintained intervals, but having specified a seasonal profile, then the indices will be displayed automatically and all other input fields will be blank.
- If creating a forecast having maintained intervals, but without applying a seasonal profile, then the total quantity will be displayed but no indices will be shown.
- If creating a forecast having maintained intervals, and having applied a seasonal profile, then the indices will be displayed automatically.

The system initially prompts in the (Select) field.

Note: If you want to use the Spread Style Forecast routine to generate daily and weekly forecasts then enter a gross forecast value only. The Generate Style Forecasts facility will spread this forecast to each family member prior to creating detailed forecasts.

Fields:

(Untitled)

Select. Enter 1 against a period or weekly forecast to break down the total to weekly or daily buckets respectively. Opens the Daily Spread window. The option is suppressed for daily forecasts.

Total Forecast Quantity

Sales forecasts only.

Enter or alter the total forecast figure and then enter an index against each forecast time bucket. If you are using a seasonal profile, then these indices will already be displayed.

If a total is entered, and indices are displayed, pressing **F17** will spread the new total in line with the defined indices.

Stock Target Quantity

Stock forecasts only.

This is the target quantity of inventory within each period.

Seasonal Profile

A different seasonal profile to the one entered on the Parameters screen may be specified if required; or one entered if the Parameters screen was left blank. This is the profile used if period to week or week to day breakdown is selected.

Note: If a code is entered, the system will validate that a seasonal profile for the model and year being forecast has been created.

If the field is left blank, the forecast figure will be spread evenly across the selected forecast periods.

Position To Period

Enter a period number to commence the display.

Index

Total Index. (Sales forecasts only.)

This field displays the sum of all the indices for the forecast period for your information. This field is re-calculated each time you press **Enter**.

Quantity

Total Quantity. This field displays the sum of all the quantities for the forecast period for your information. This field is re-calculated each time you press **Enter**.

Period

For your information, this field displays the forecast breakdown in terms of daily, weekly and period buckets.

Daily buckets display in the same format as weekly buckets except that the Start field shows the day and not a start date. You cannot maintain or select these buckets.

Weekly buckets display in the format PPnn where 'PP' is the period number, and 'nn' the week number. For example, 0730 signifies week 30 in period 07. To break down these periods into daily buckets, use the Select field.

Period buckets use a period number to indicate buckets, for example, '01' or '02' or '10'. To break down these periods into weekly buckets, use the Select field.

If no seasonal profile is used, or if the profile has no daily indices set up, then the Company Profile weekly template of working and non-working days will be used to distribute the forecast figure over the daily forecast.

Start

This field displays the 1st day in the period or week. If displaying daily buckets, this field displays the day.

Index

This field determines which way to spread the forecast over a period of time. Enter an appropriate index value to determine the way the forecast is to be spread over a period of time. **F17=Apply Index** uses the index as a ratio of the total index multiplied by the total quantity to give each individual forecast period quantity.

If you entered a seasonal profile on Maintain Family Sales Forecast screen 1, then Style completes this field.

Quantity

The figure may be generated, or entered manually.

Backlog At

(Sales forecasts only.) This field displays, for your information, only if you set the Include Backlog field on Maintain Family Sales Forecast screen 1. This column shows the outstanding sales orders due within the last run dates of the last MPS run for the selected planning model.

Value

Total Value. Sales forecasts only.

Functions:

F8

Create. Creates initial forecast.

Update. Updates forecast, when additional forecast values have been added; or existing forecasts updated.

F14

Barchart. Displays the Forecast Barchart screen. This screen displays a barchart representing the forecast variation throughout the forecast year.

F17

Apply index.

F18

Stock forecasts only. Toggles between displaying Quantity and Value.

F20

Update/Style Level Forecasts. Saves the current forecast details and enables you to create style level forecasts. This functions in the same way as the standalone Generate Style Forecast option.

F22

For stock forecasts only, opens the Stock Level Profile window, from which you can build a stock profile.

Weekly Spread Window (Option 1)

To display this window, enter 1 in the Select field against a period forecast from Maintain Family Sales Forecast screen 3.

Use this window to spread period forecasts to weeks. You can also spread weekly buckets to days.

```

Fields:

Week Total

Displays the figure for the selected week. You can adjust this figure and spread the total across each day in the week.

Index

Entered Index. This field is for your information only and displays the sum of all the indices for the week.

Quantity

Entered Quantity. This field is for your information only and displays the sum of all the quantities in the week.

Index

Enter or update the index for that day.

Quantity

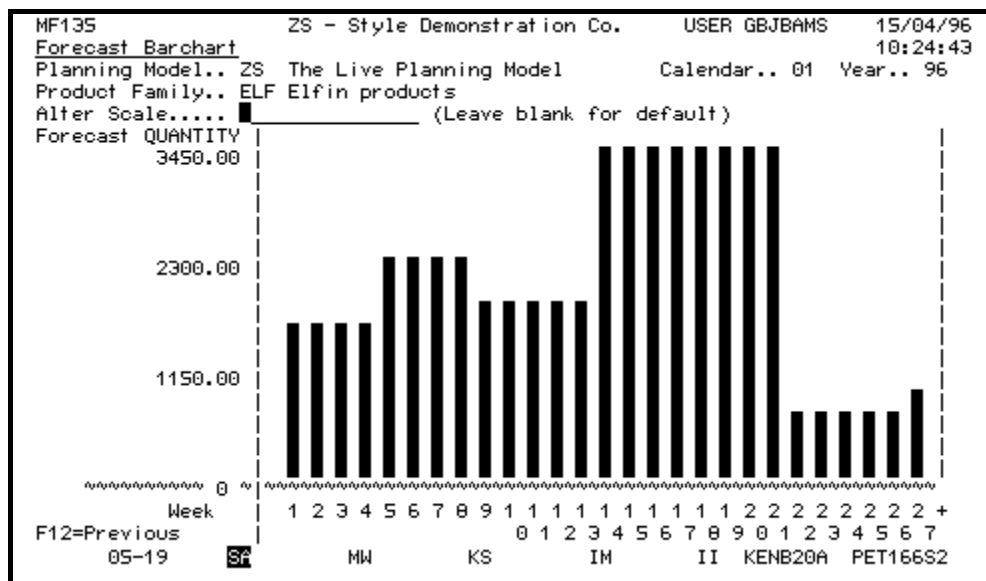

Enter or update the quantity for that day.

Forecast Barchart screen (F14)

To display this screen, select **F14=Barchart** on Maintain Family Sales Forecast screen 3.

The barchart provides a graphical representation of the forecast quantity variation throughout the forecast year. Weeks 1 to 27 are displayed initially, with weeks 28 - 53 visible when you roll up using PageDown (or equivalent).

Fields:

Alter Scale

Enter a figure to change the default scaling rule. Because a weekly increment is used, the following rules apply to period and daily forecasts:

- Period forecasts are divided by the number of weeks contained in the period. For example, if a period of 4 weeks has a forecast of 200, each week is displayed as $200/4=50$.
- Daily forecasts are accumulated throughout the week and the resulting weekly total displayed.

The Y-axis is calculated from the maximum forecast quantity, and may be changed by entering a figure in the Alter Scale field.

Select Item window (F20)

To open this window, select **F20=Update/Style Level Forecasts** from Maintain Family Sales Forecast screen 3.

Use this window to update forecasts at the style level. The window displays all the styles in the product family. The window also displays the associated percentage distribution to use when calculating the forecast spread.

For each style, you can calculate and display forecast quantities relevant to each style.

```

Fields:

(Untitled)

Select. Enter 1 against a style to maintain its specific forecast quantity.

Position To

Enter a style or variant at which to commence the display.

Stock Level Profile Window (F22)

For stock forecasts only, select **F22** from Maintain Family Sales Forecast screen 3 to open this window.

This function enables you to build a stock profile by entering:

- Date range.
- Target date.
- Target value.

The date range defines the dates over which the forecast is to be built, and the quantity specifies the stock level which should be attained on the target date. A stock forecast will then be generated to meet the profile. It is possible to build a stock profile over more than one forecast year by defining the same four parameters over consecutive years.

For example, a from date of 01/01/96, a to date of 31/12/98, a target date of 07/06/97 and a target level of 5,000 would produce a three year stock build profile if the option was run over years '96, '97 and '98.

Define the dates over which the forecast is to be built.

Target Date

Enter the date at which the target should be achieved.

Target Value

Enter the stock value you hope to achieve by the target date.

Generate Style Forecast

12/P1F

Select Generate Style Forecast from the menu to display the Generate Style Sales Forecast screen.

Use this option to generate a style level forecast for one or more product families. The option explodes each selected product family into forecasts for each individual family member in proportion to the percentages defined via the Maintain Family Forecast option.

Subsequently, use the Maintain Style Forecast option to view the forecast.

Note: This option is only relevant to product families.

Warning: This process will regenerate forecasts for ALL styles in the selected product families. If you have amended individual member forecasts, then these too will be overwritten.

Generate Style Sales Forecast Screen 1

Use this screen to select a planning model and a year for the forecast. You can also select a range of product families.

Fields:

Model

Enter the relevant planning model.

Year

Enter the year to forecast.

Family

Enter a product family range. To select from all product families within the planning model, leave this field blank.

Generate Style Sales Forecast Screen 2.

This screen displays the selected product families.

Maintain Style Forecast

13/P1F

Use this option to key in forecasts at either style level or style variant level:

- Style level. The Forecast Level for the style must be set to 0 (ie Style level) on the Production Details screen under the Style/Material Details option.
- Style variant level. The Forecast Level for the style must be set to either 1 (style/colour level) or 2 (style/colour/size(s) level), as appropriate, on the Production Details screen under the Style/Material Details option.

Tip: If you key in forecasts at style level, you can use the Generate Variant Forecast option subsequently to spread the forecast to style variant level.

Maintain Style Sales Forecasts Screen 1

To display this screen, select Maintain Style Forecast from the menu.

Use this screen to enter a planning model and year.

MF110	ZS - Style Demonstration Co.	USER GBJBAMS	15/04/96 13:23:11
Maintain Style Sales Forecasts			
Model?.. █			
Year 96			
Item?.. _____			
Forecast Basis 1 (1=Quantity 2=Value)

Maintain Intervals... _ (1=Yes)			
Include Backlog..... _ (1=Yes)			
F3=Exit F4=Prompt			
06-42	82	MW	KS IM II KENB20A PET166S2

Fields:

Model

Enter the planning model to which this forecast applies. If you are using the forecast to drive MPS and MRP, enter the live planning model.

Year

Enter the year to which the forecast relates.

Item

Enter the style or style variant for which you wish to create or maintain a forecast. The level you enter must be compatible with the Forecast Level set up for the style on the Production Details screen under the Style/Material Details option. For example:

- If the Forecast Level for a style is set to 0 (ie style level), then enter the style.
- If the Forecast Level for a style is set to 1 (ie style/colour level), then enter a style/colour variant.
- If the Forecast Level for a style is set to 2 (ie style/colour/size(s) level), then enter a style/colour/size variant.

Warning: If you enter a style level that is not compatible with the style's Forecast Level, then the screen displays the following error

message: Item is not a Forecast Item.

Warning. *If maintaining a forecast generated from a product family, remember that any re-generation of style forecasts will overwrite any maintenance values entered here.*

Forecast Basis

Enter one of the following:

- 1 - Quantity. Base the forecast on quantity.
- 2 - Value. Base the forecast on value.

Seasonal Profile

Enter a seasonal profile set up from the Maintain Seasonal Indices option (optional). This seasonal profile can act as a template when entering forecasts. Figures are automatically apportioned according to the rules defined by the seasonal profile.

By entering a seasonal profile, you also determine the level to which you can maintain the forecast:

- Weekly seasonal profile. You can enter daily and weekly intervals only on Maintain Family Sales Forecast screen 2.
- Period seasonal profile. You can enter daily, weekly and period intervals on Maintain Family Sales Forecast screen 2.

To spread values for the forecast evenly, leave this field blank. In this case, you must perform any manipulation manually.

Maintain Intervals

The option is given to define how to spread the forecast total, without entering each spread figure individually. Enter one of the following:

- 0 - No. Display Maintain Family Sales Forecast screen 3.
- 1 - Yes. Display Maintain Family Sales Forecast screen 2, from which you can specify the total forecast quantity or value and define how to spread the daily, weekly and period time buckets.

Include Backlog

The option is given to display the outstanding sales orders due within the run dates of the last planning run for the forecast model selected. Enter one of the following:

- 0 or blank - No.
- 1 - Yes.

Set the Maintain Intervals field to 1 and press **Enter** to display Maintain Style Sales Forecasts screen 2.

Leave the Maintain Intervals field blank and press **Enter** to display Maintain Style Sales Forecasts screen 3.

Maintain Style Sales Forecasts Screen 2 (Option 1)

Set the Maintain Intervals field to 1 on Maintain Style Sales Forecasts screen 1 and press **Enter** to display this screen.

This screen is the same as Maintain Family Sales Forecast screen 2. For more details, refer to the Maintain Family Forecast option.

Spread Style Forecast

14/P1F

Use this option to produce a horizontal spread by spreading gross forecasts to daily and weekly intervals. These forecasts would usually have been entered at product family level, then generated for each style, but would not contain a detailed breakdown to style variant level.

Use this option also to spread forecasts entered at style level rather than by product family.

Breakdown intervals must be contiguous and at least one set of intervals must be entered.

Note: Any existing forecast within planning intervals inconsistent with the interval parameters entered will be highlighted on an exception report and not updated.

Spread Style Sales Forecast Screen 1

To display this screen, select Spread Style Forecast from the menu.

Fields:

(Untitled)

Select. Enter 1 against a style to create daily and weekly forecasts in accordance with the interval parameters to be set.

Seasonal Profile

Enter a seasonal profile or overwrite the one that already exists.

This field defaults to the seasonal profile, if any, entered from the Style/Material Details option.

Total Forecast Quantity

This field displays the generated forecast for your information only.

Note: This field displays a value only if a value forecast has been generated.

Daily Forecasts From/To Week

Enter the week number range within the planning model for which daily forecasts are to be produced.

Weekly Forecasts From/To Week

Enter the week number range within the planning model for which weekly forecasts are required.

Functions:

F8

Submit job. Submit job for processing.

F15

Select all.

F18

Display Values. Toggles between displaying Total Forecast Quantity and Total Forecast Value.

Generate Variant Forecast

15/P1F

Use this option to explode all forecasts down to variant level.

To determine how to spread forecasts from style level down to variant level, this option uses the information you have entered for routes in the Variant Spread window under the Style Route/Bill Of Materials option.

Subsequently, there is no real way to look at forecasts at variant level. However, this option may make slight modifications to the forecast at style level. To view these modifications, go back to the Maintain Style Forecast option.

Warning: If you do not run this option, MPS will consider the forecasts at variant level as a demand. However, the MPS output screen will show forecasts as unexploded forecasts with code YF alongside. MPS will suggest production orders to satisfy this demand, but cannot suggest the variant ratio; that is, the production order at style level. Also, MPS cannot consider any existing stocks that you might already have.

Spread Style Forecast Screen 1

Select Generate Variant Forecast from the menu to display the Spread Style Forecast screen.

Use this screen to enter a planning model and year.

Fields:

Model

Enter the relevant planning model.

Year

Enter the relevant year.

To display Spread Style Forecast screen 2, press **Enter**.

Spread Style Forecast Screen 2

To display this screen, press **Enter** from Spread Style Forecast screen 2.

This screen displays style forecasts exploded down to variant level.

Fields:

(Untitled)

Select. Enter a 1 against each style to spread forecast.

Total Forecast Quantity

This is the total forecast quantity which will be spread between each variant in accordance with the variant spread defined on the style's planning route/BOM.

Current Spread

If you have already spread a style forecast down to its variants, this field displays 1 for your information only.

Maintain Model Stockrooms

21/P1F

Use this option to set up a planning model.

This option is the same as a Style Production Scheduling option. For more information, see Maintain Reporting Profile in Style Production Scheduling.
