Chapter 1

Production Order Maintenance

The Style Production Interface To Warehousing

There are two ways in which Style Production interfaces with the Warehousing application:

- Issuing materials from a warehouse inventory into production.
- Receiving finished styles from production into a warehouse inventory.

Creating The Warehouse/Item Profile

For each style or material that you wish to keep in a warehouse location, use the Item/Warehouse Profile option within Warehousing to create the link between style/material and warehouse. You have to put in these associations for each style variant and material variant.

Committing is the warehouse equivalent of allocation in Inventory Management. When you run the Pick List For Production option in Warehousing, this option commits specific elements of stock in the warehouse locations to the production order. This reduces the available stock in these locations.

You can define:

- Stock rotation rules.
- Physical position.
- Picking locations.
- Default pack type.
- Put-away conditions.
- Rules to use for committing.

Note: If you wish to use warehousing rules rather than lot allocation, then you must arrange for commitment to take place using rotation date rather than picking location. Therefore, switch on date rotation and leave the pick face blank.

Note: If you change the commitment details on the item/warehouse profile, the changes only affect subsequent ungenerated material requirements for production orders.

Issuing Materials From A Warehouse

Warehouse controlled materials are issued from Warehousing rather than from Style Inventory Management. The interface allows you to pass on material requirements from Style Production to Warehousing.

The warehouse requirements are printed on a pick list, picked and issued. The warehousing issuing process mirrors closely the Style Production issuing process.

Warning: Avoid setting up floorstock and subcontract stockrooms as warehouses!

In Style Inventory, backflush materials are issued from the booking programs. In Warehousing, you must issue backflush materials from the Issue Materials option in the same way as non-backflush materials.

The issuing stockroom for a material determines whether the material is controlled by Style Inventory or Warehousing. The issuing stockroom is set up in the Sourcing Warehousing field on Product Maintenance Screen 5 under the Style/Material Details option.

If you specify lots in Style Inventory for a warehouse-controlled material, these lots override the Warehousing lot rules.

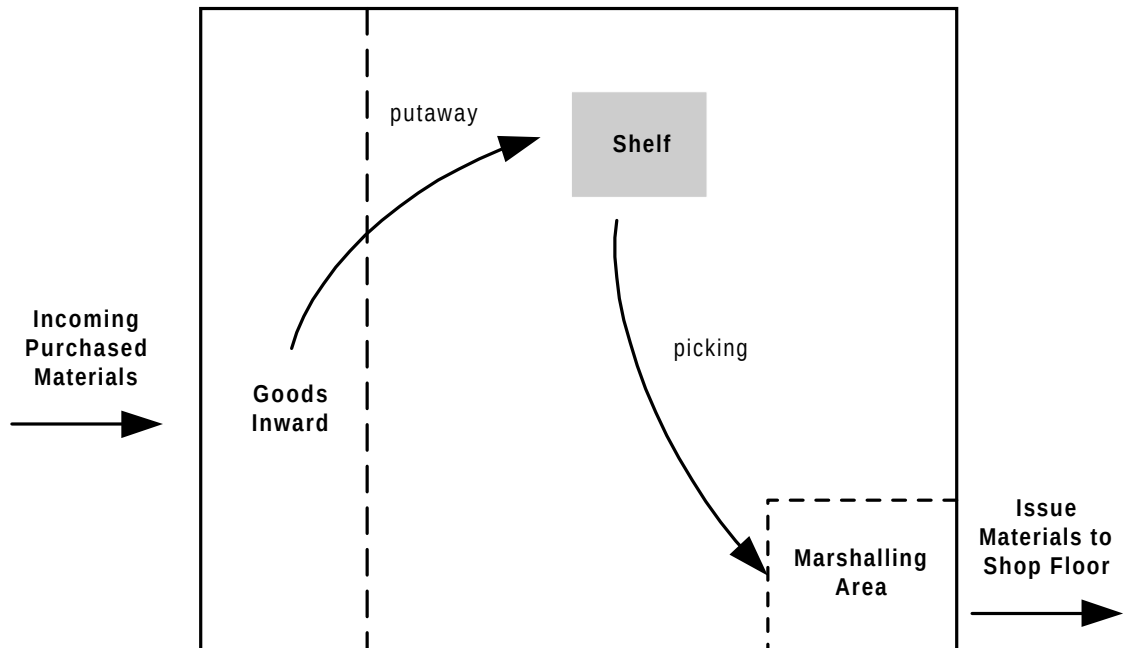

To generate a requirement for warehouse controlled material, use one of the following options:

- Release Orders. Set the Create Warehouse Requirements field on Production Order Release Screen 2 to 1. This option generates warehouse requirements for lot controlled materials only.
- Generate Warehouse Requirements. Use this option if you wish to leave a gap before generating material requirements. In addition, you can manipulate warehouse requirements for non-lot controlled materials and incorporate warehousing rules.

The procedure to follow for moving warehouse controlled materials from the warehouse to the production floor is given below:

1. Print a pick list.
2. Confirm picking.
3. Confirm issue for production.

Warehouse

Print A Pick List

Use the Pick List For Production option within Warehousing to pull together the generated material requirements and produce a pick list and marshalling list:

- **Pick List.** The pick list contains a number of lists, one per order/schedule. Within each list are all the warehouse controlled components required, their quantities, locations within the warehouse and if appropriate lot details.
- **Marshalling List.** The marshalling list simply shows all the pick lists generated, together with details of which order/schedule and issue they satisfy, the finished goods associated with that order/schedule and the due date.

To decide which rules to apply to each material, this option uses the details set up on the Warehouse/Item Profile and any information you entered when you generated the requirement.

The lots to be picked from the pick list are present as a result of one of the following:

- Material may have been allocated already from a stock inventory using either the Release Orders or Material Availability options.
- The lots may have been determined as a result of the warehousing rules but not yet allocated within inventory. If this is the case, then the Material Availability option shows the material that is unallocated until you confirm the pick.

Confirm Picking

Use the Confirm Pick For Production option within Warehousing to record:

- What has been picked.

- Which lots have been picked.
- The picking location.
- The quantity picked.

This option transfers picked warehouse materials from their stored locations to the marshalling area.

If the lot was picked using warehouse rules, new lot allocations may be created within inventory. Likewise, any changes in the pick from the lot printed on the pick list result in a corresponding change of allocations within inventory.

If a different lot is picked and an allocation exists for the original suggested lot:

- The allocation decreases by the quantity picked.
- A new allocation is created for the lot picked.

Likewise, a picked lot which has no allocation because it was generated as a result of using warehouse rules can be allocated in lot inventory, if required. This requirement is determined by the Allocation Of Materials At field on Maintain Company Profile screen 4 being set on and the level of allocation on the material being set to 1, denoting that allocation at a stock inventory level has already occurred during order confirmation or release.

Note: It is not possible to use this option to over pick. Over picking should be done via the relevant Generate Warehouse Requirements option.

Confirm Issue For Production

Use the Confirm Issue For Production option within Warehousing to issue the picked warehouse materials from the marshalling area. The option:

- Reduces the physical stock balances in the warehouse inventory stockroom.
- Records the issued quantity against the production order WIP or increases the physical and allocated floorstock.

You may change the issue details (quantities and lot) and issue the material. As you issue material, allocations decrease in the same way as standard inventory. Inventory updates mirror closely Issues Materials updates in Style Production.

You may not issue from another stockroom. If an order is not active, you can change the stockroom from an inventory stockroom to a warehouse stockroom by selecting **F18=Amend Details** from Production Order Maintenance Screen 2. Alternatively, change the stockroom on the Material Details window under the Issue Materials option.

If there is a lot of that particular material already in the marshalling area, you may decide to issue that lot instead of the picked lot. In this case, Warehousing displays a warning if the material in that lot is allocated to another production order. Any unallocated material that is issued is offset against any unissued allocated material, thus ensuring that all inventory is de-allocated to the level of issue.

Note: Stock that is picked but not issued to an order, will remain in the marshalling area and will not be available for issue to other orders.

Note: When material issues are completed in warehousing, you may deallocate any unissued material from warehouse inventory by entering a 3 to force completion. To deallocate of material in stock/lot inventory, you should use the material completion function of the Issue Materials option to bring the allocations back into line. If you do not do this, the material is freed eventually when you complete the production order.

Unplanned Issues

To carry out unplanned issues, use the Issue Materials option. This option takes the material out of the warehouse marshalling area.

It is your responsibility to reconcile stock levels by transferring the equivalent material from the appropriate location into the marshalling area.

Note: Do not make unplanned backflushed issues from a warehouse.

Returning Material To The Warehouse

To return material, use the Issue Materials option. This option puts the material back into the warehouse marshalling area and enters a negative quantity against that material on the production order.

It is your responsibility to transfer the material from the marshalling area to an appropriate location within the warehouse. If necessary, you should re-apply a commitment to production.

Unlike finished goods receipts, no paperwork, such as the put-away list and labels, is issued at this point.

Receiving Finished Styles Into A Warehouse

The receiving stockroom for a style determines whether the finished style is put-away into a warehouse controlled inventory stockroom. The receiving stockroom is set up in the Sourcing Warehousing field on Product Maintenance Screen 5 under the Style/Material Details option.

Note: For an individual route, you can override the receiving stockroom from the Style Route Header Maintenance Screen under the Style Route/Bill Of Material option.

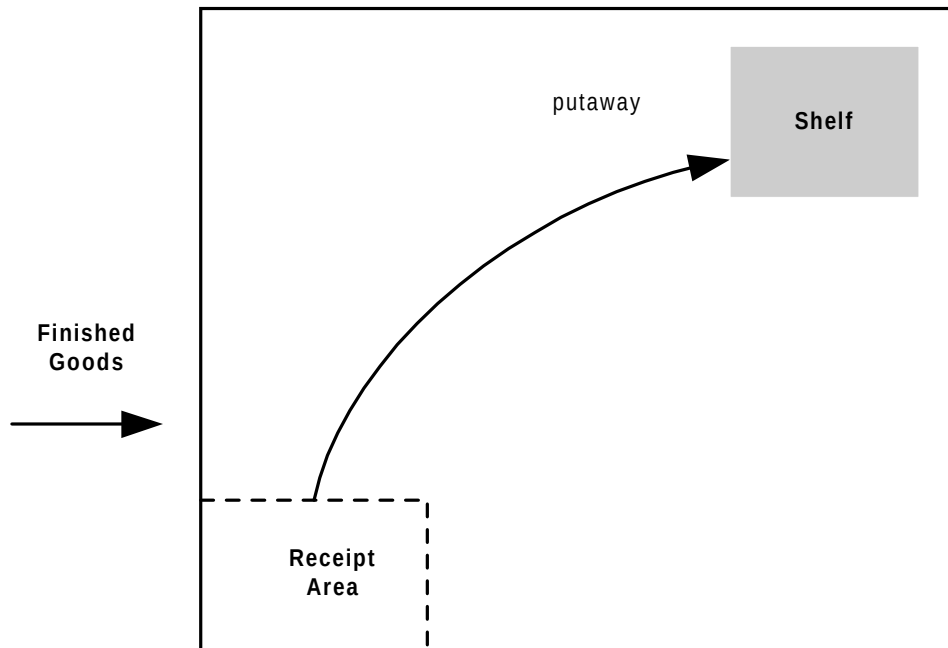

When booking the final operation on a production order, you can change the receiving stockroom to a non-warehouse controlled inventory stockroom.

If you confirm that the receiving stockroom is warehouse controlled, Warehousing requires you to specify a pack type such as box or pallet for each variant.

The procedure to follow for moving finished styles from the production floor to a warehouse is given below:

1. Complete the order.
2. Use the Process Receipts For Put-Away option within Warehousing to move the finished styles into the Receipt Area. Alternatively, to carry out this activity automatically, start the Warehousing sub-system.
3. Use the Put Away Labels option within Warehousing to produce put-away labels. These labels specify the finished styles' movements from the Receipt Area to the recommended locations. Alternatively, to carry out this activity automatically, start the Warehousing sub-system.
4. Stick the labels onto the boxes and put-away the finished styles into their appropriate locations within the warehouse.
5. Use the Confirm Put Away option to confirm to Warehousing that you put the finished styles away correctly. Therefore, Warehousing can expect to find the finished styles at the locations specified in the put-away list, unless you amended the put-away list.

Warehouse

For more information about the put-away process, refer to the Warehousing product guide.

Returning Finished Styles to WIP

To return finished styles to WIP for rework, use one of the transaction booking options to process a negative receipt.

However, because there are different rules as to where the finished styles are put-away, a negative receipt always decreases the receipt area within the warehouse.

It is your responsibility to transfer the finished styles back to the warehouse receipt area to reconcile the figures.

Maintain Orders

1/P4M

Use this option to carry out the following activities:

- Create a production order. When creating an order, the screen displays the following sub-heading: *Enter New Order Details.
 - Specifying variant quantities changes the status of the order to 'Planned'.
 - Once at this status, the routine is regarded as existing order maintenance and not order creation.
 - **F19** subsequently creates the operational details and changes the status to 'Confirmed'.
 - The system prompts initially in the Style field.
- Maintain a production order. When maintaining an order, the screen displays a sub-heading of *Existing Order Maintenance and prompts initially in the Quantity field.
- Modify/confirm production orders previously created on a back to back basis for a sales order.

Material Allocations

If you have set the Allocation Of Materials At field to 1 (ie allocate at order confirmation) on Maintain Company Profile screen 4, then material for the production orders is allocated automatically upon confirmation.

If, subsequently, material requirements change, then the allocations change to meet the new specification. This may be done before or after the release of the production order. This may include lot allocations which remain intact. However, when material requirements decrease, over or under allocations may occur. Therefore, if lot allocations are present on a production order being amended, then this option gives a warning.

MRP

The following applies only if MRP is on-line and the Order Maintenance reason code is active. For more information about this code, refer to Net Change Reason Codes in Style Production Planning.

Ad hoc updates fall outside planned changes and affect the planned demand of the materials attached. Therefore, you can arrange to generate triggers for the next net change MRP run for such updates. If an order is for an MRP item, then any of the events below can generate a trigger for the ordered style. If an order is for an MPS item, then any of the events below can generate a trigger for the MRP components.

- Creation of an unplanned production order.
- Change of date in an existing production order.
- Change in quantity in an existing production order.

For more information about generating triggers for net change MRP runs, refer to Net Change Reason Codes in Style Production Planning.

Production Order Maintenance Screen 1

Select Maintain Orders on the menu to display
Production Order Maintenance screen 1.

Use this screen to enter a range of selection parameters in order to display a list of orders in a window for subsequent selection.

```

Fields:

Production Order

- To maintain an existing order, enter the order number.
- To create a new order with a generated order number, leave this field blank and press **F8=Create New Order**.
- To create a new order with a specified order number, enter the order number and press **F8=Create New Order**.
- To select from a range of orders, leave this field blank, set your selection parameters, and press **F16=Review Orders**.

Or Select By

The following fields constitute search criteria for a production order review. The fields may be used independently or collectively.

Style

Enter a style code.

Route Or All Routes

If the search is to find orders relating to a specific route, enter the code here.

To include all routes, accept the default of blank in this field and the default of 1 in the All Routes field. These two fields are mutually exclusive.

Reference

An entry limits the selection to those orders that match entries made in the Reference 1 field on the order header.

Orders Due Range

Limits the orders selected to those with a due date after that entered in the Due From field, but prior to the date entered in the To field.

Functions:

F8

Create New Order. Display Production Order Maintenance screen 2 from which you can create a production order.

F16

Review Orders. Open the Production Order Selection window which identifies orders in accordance with entered parameters and displays them in a window for selection.

Enter an existing production order in the Production Order field and press **Enter** to display Production Order Maintenance screen 2.

Production Order Selection Window (F16)

If you do not know an order number, you can use this window to review available orders. This window includes orders that fall within the parameters set on the Selection screen. Column codes are; T, text exists; Sts, status; St, stockroom; R, route.

Select **F16=Review orders** on Production Order Maintenance screen 1 to display the Production Order Selection window.

22-32 SF MW KS IM II KENB20A PET166S2

Fields:

S(select)

Enter 1 against each order you wish to maintain; order details are displayed alternately.

Enter 2 against an order to display any associated header text; orders with text are indicated in the T(text) column by inclusion of an asterisk (*).

T

Text. Where an order has associated text, this field displays an asterisk.

Position To

Enables you to enter an order number to commence the display from. This is useful if there are several pages to display.

Functions:

F22

Displays extended details against each order.

Production Order Maintenance Screen 2

-  To display this screen, enter an existing production order in the Production Order field on Production Order Maintenance Screen 1 and press **Enter**.
-  To display this screen, select **F8=Create New Order** from Production Order Maintenance Screen 1.
-  To display this screen, enter 5 in the Option field against a suggested or existing production order on Review Detail screen 1. For more information, refer to the Review Production Schedule option in Style Production Planning (Master Production Scheduling).
-  To display this screen, enter 5 in the Option field against a suggested production order on Enquiry Detail screen 1. For more information, refer to the Review option in Style Production Planning (Material Requirements).

Use this screen to create or maintain an order header for a production order.

Fields:

Production Order

A unique reference must be given to each order. Manual entry depends on the setting of the Order Number to be System Generated flag on the Company Profile that indicates whether you will enter the order number; or the application will generate a number prefixed by W. If user entry is mandatory, the system will

prompt at the field if an attempt is made to update without specifying an order number.

Note: Even if system generated is the application default, a unique number may be entered manually if required.

The order number can only be changed when the order is being created, after which it is fixed

Status

System maintained field; displayed when reviewing an order.

Note: Orders with a status of 'Cancelled' and 'Complete' cannot be displayed as they are non maintainable

Order Type

System maintained field; displays 1 for both standard and amended standard orders.

Style

Enter the style to be produced by the order. Only maintainable when creating orders.

Route Code

This must be a valid route for the style entered. Only maintainable when creating orders.

UOM

System maintained field; displays the unit of measure defined on the style route.

Quantity

Enter the quantity (inclusive of all variants) to be produced by the order. The quantity may not be changed once the order has been released, although it is possible to produce and book more or less than the planned quantity before completing the order.

Note: A subsequent window will prompt for the distribution of this quantity across variants

Note: After entering a quantity, pressing Enter will cause the system to calculate and display Due, Start and Latest Start dates, prompt for variant details and create a planned order

Note: You can reduce or increase the quantity on a previously created back to back order. However, the program displays a warning and reports the action on the demand exceptions report.

Note: If multiple sales orders are attached to a production order, then you may not reduce the quantity. The program displays an error message.

Stockroom

System maintained field; displays the receiving stockroom defined on the style route.

Tip: The following date fields can be calculated automatically by the system; however, be aware that the system will use the production calendar specified on the Company Profile by default; if a different calendar is required, be sure to enter it before requesting automatic calculation.

Due Date

Enter the date by which the order must be completed. Alternatively, leave blank to calculate automatically from the start date by forward scheduling, assuming a start date of today.

Note: You are allowed to push the production order due date past the due date for any sales orders that may be reserved against this production order. However, the program displays a warning and reports the action on the demand exceptions report.

Due Week

This field displays, for your information only, the number of the week when the order must be completed. It is displayed in the format nnYY where 'nn' is the week number, and 'YY' the year.

Start Date

Enter the earliest date on which work can begin in order to meet the due date. Alternatively, enter the date you wish to start work. To calculate automatically from the due date by backward scheduling, leave blank.

Start Week

This field displays, for your information only, the number of the week when the order is destined to start. The week is displayed in the format nnYY where 'nn' is the week number, and 'YY' the year.

Latest Start Date

This field displays, for your information only, the date calculated from the due date by backward scheduling. This date represents the latest date possible to start the order and still meet the due date based on the lead time of the order.

If the lead time is greater than the time available to complete the order, then the Latest Start Date may conceivably be in the past. In this case, the system displays a warning message.

Latest Start Week

This field displays, for your information only, the latest start week. The week is displayed in the format nnYY where 'nn' is the week number, and 'YY' the year.

Calendar Code

Enter an alternative production calendar for calculating due, start and latest start dates when forward scheduling. To use the default calendar held on the Company Profile, leave this field blank.

Note: This calendar does not override that held on a machine definition when backward scheduling

Production Stage

This function may be used for two purposes:

- Change descriptions associated with Reference 1 & 2 fields.
- Control batch allocation of lot controlled materials.

Usage is defined on the parameter file, against type VPOL.

Planning Filter

This entry specifies the item's default rescheduling policy during MPS and MRP processing. These rescheduling policies may be used to determine whether production orders at a particular status can be rescheduled, or if the order quantity can be increased or decreased.

Planning filters also provide the facility to exclude recommendations for insignificant or unworkable changes to the quantity or due date of the supply (order).

Blank - No special conditions apply.

Non-Blank - A planning filter is generated by utilising a planning filter alpha character as a suffix to the production order status. Production order status codes are as follows:

'41' - Planned

'42' - Confirmed.

'43' - Released.

'44' - Active.

The status/filter combination refers to a particular set of quantity and date rules that must be obeyed in preference to the default rules by MPS and MRP processing. Each filter character must be specifically defined against each order status.

For example: if a planning filter character of S is entered, when a production order is confirmed, it will have a status of '42S'. The effect this will have on MPS and MRP recommendations will depend on how you have defined S. It may be defined as 'confirmed, cannot cancel' or 'no changes allowed'. Filters are specific to an order status, but may be applied to any item. If a filter is not defined, via Parameter File Maintenance then entering a code here will have no effect on the planning process. Planning filters are defined on the parameter file, against type WTYP. See Style Production Definition Management product guide for additional information.

Print Order

Indicates whether the production order is printed when F8 is pressed. Orders at every status can be printed automatically. The default value of this field is

determined by the Print Documentation at Confirmation/Release flag on the Company Profile.

Reference 1

This field enables orders to be grouped by a common factor, for example, customer. The reference can be used to select orders when releasing, issuing materials and completing orders; or when making enquiries and requesting reports. Enter upper case characters only.

Reference 2

Enter any memorandum reference text that is stored with the order header. Enter upper case characters only.

This field does not aid in any order selection.

Functions:

F8

Add New Order: When entering a new order, select this function to create a planned order. For an MRP suggested order, select this function to create an order number for the order and change the status to Planned.

Update Order: Only displayed when maintaining an order; confirms any updated details.

F11

Use this function to delete an order that has attained 'Planned' or 'Confirmed' (but materials have not been allocated) status. If materials have been allocated to the order and the order has been confirmed, use the Order Completion option to cancel the order.

F17

Reservations. Display the Reservations Enquiry window, from which you can view any sales orders that are reserved against the selected production order.

Note: F17 is available only where there is a reserved quantity against an existing production order.

F18

Amend order. Only displayed when maintaining a confirmed order; enables you change standard route details. The order type is then updated from Standard to Amended Standard

F19

Confirm. Displayed when creating an order. Creates material and resource requirements and changes the order status to Confirmed.

If the Allocation of Materials At flag on Maintain Company Profile screen 4 is set to 1, the system automatically allocates all material requirements as per the production route. If the allocation would cause stock to go negative, or increase an already negative balance, a warning message is displayed.

If the Allocation of Materials At flag is set to 2, then allocation does not take place until you release the order.

Amend Details. Displayed when maintaining a planned order.

F21

Enter or amend text against the order header

F24

Display, allowing maintenance for a 'Confirmed' order, variant spread of which the total quantity is comprised

Variant Quantities Window (F24)

This function is used to specify which, and the number of, variants that the order is to produce.

F24 on Production Order Maintenance screen 2 opens this window.

Note: This window is opened automatically when creating an order and when changing the quantity on the order header

Fields:

Ord Qty

Order quantity displays the planned/confirmed order quantity that was entered on the Order Header Maintenance screen.

Entered Qty

System maintained field; displays the sum of quantities you have entered against the variants.

(Variant Quantities)

When creating an order, the system will calculate the quantity for each variant based on the variant spread entered on the route. The total of the variants may not be exactly the same as the quantity entered on the header, due to rounding. This actual total is passed to the order header.

Changing the total quantity in this window will affect the quantity displayed in the Quantity field on the order header.

Functions:

F10

There are two display modes for the matrix: 10 sizes with inputs up to 99999; 15 sizes with inputs up to 999. This function will toggle the display from the default to the other available display.

Production Order Maintenance Detail Order Screen (F18)

This screen enables you to change a standard route to suit a requirement particular to this order. Functionally, the system facilities available are similar to those available when creating or maintaining a route; except that it is not possible to copy details from an existing route.

F18 on Production Order Maintenance screen 2 when displaying a 'Confirmed' or 'Released' order displays this screen.

Note: The Production Order Release facility also provides the facility to amend an order. But the materials are maintained at the material variant (SKU) level and the total quantity required - not the quantity per - is input/updated

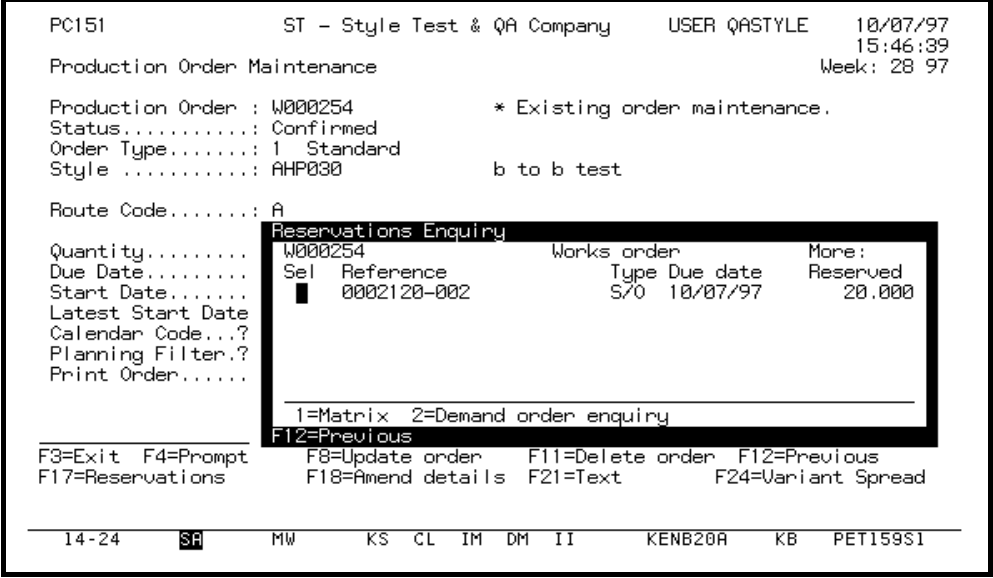

Tip: Route/BOM Maintenance is covered in detail under Style Production Definition Management (option 11/P1M).

Release Orders

2/P4M

Use this option to release confirmed orders for production in order that work may be reported (booked) or materials issued.

Optionally, you can also:

- Allocate materials at stockroom.
- Allocate materials at batch/lot level.
- Generate a requirement for allocated warehouse lot-controlled materials.
- Print order documentation.
- Issue materials.
- Create bundles.

Note: To generate a requirement for unallocated warehouse lot-controlled materials, use the Generate Warehouse Requirements option.

Three reports are produced as part of the release procedure:

- Order Release Report.
- Materials Issues Exceptions Report.
- Purchase Order Creation from Production Report.

Note: If any of the sales orders attached to a production order has been cancelled or suspended or is a quote, this menu option allows you to examine the orders before confirming release.

Allocate Materials At Stockroom

To arrange for automatic allocation at order release, set the Allocation Of Materials At indicator on Maintain Company Profile screen 4 profile to 2. If this field is set to 1, then materials will have already been allocated at order confirmation.

If the allocation would cause stock to go negative, or increase an already negative balance, a warning message is displayed. Material issues are not affected by allocation. If issues are required, they take place regardless of allocation requirements

Allocate Material At Batch/Lot Level

The function also allows access to material availability displays, order amendment, trial allocation, actual allocation of lot materials, and trial kitting routines.

Print Order Documentation

Printing of order documentation has default values set on the Company Profile, but these can be overridden for an individual or a range of orders.

Order documentation printing will be actioned in either batch or interactive mode, depending on the setting of the Issuing / Printing Interactive or Batch flag on the Company Profile

Issue Materials

The automatic issuing of materials to the first or all operations has default values set on the Company Profile, but these can be overridden for individual or a range of orders.

- Material issues will be actioned in either batch or interactive mode, depending on the setting of the Issuing / Printing Interactive or Batch flag on the Company Profile
- Material issues will be actioned immediately if issuing in interactive mode. The system will display 'Materials are being issued, please wait' if issuing in interactive mode. Until the issue is complete, no further processing can be invoked
- The system will display an error message if issues would cause stock to go negative, or increase an already negative balance; but note that it is not possible to cause a lot controlled balance to go negative. Stock will be issued up to the balance and then stop. You must subsequently issue materials on a manual basis when the stock balance is suitable

Create Bundles

The automatic creation of bundles has default values set on the Company Profile, but these can be overridden for individual or a range of orders.

There are two ways to release an order:

- By entering an order number directly for a production order at status Confirmed. This method offers the immediate option to maintain an order:
 - To release a series of orders in this way, select an order, set parameters, release and use **F12** to return to the Production Order prompt; enter a new order number and re-iterate until all required orders are released. **F3** will then invoke the documentation printing, issuing and bundle creation options where appropriate
 - If the order is being maintained at the time release is requested, the system will display an error message stating, 'This order is currently being maintained by user 'xxx' at terminal 'nnn' Maintenance started at 'time' This user must complete maintenance before release is allowed
- By using **F16** to display a list of orders (which may be subject to selection parameters) from which any number can be selected and released together

Order Release Report

This report is produced automatically when orders are released and identifies all orders that have had their status changed from Confirmed to Active.

It will also identify all those orders where the available stock of materials has now been set to negative or whose already negative stock balance has been increased.

Material Issues Exceptions Report

This report is produced automatically when orders are released and identifies material issues that could not be made because of a zero or negative stock balance.

The report will not be produced if all material issues were successful or if automatic material issue was not selected.

Purchase Order Creation From Production Report

This report is produced automatically when orders are released, if there are operations flagged as requiring subcontract orders, and identifies all new purchase order/lines created for subcontract operations.

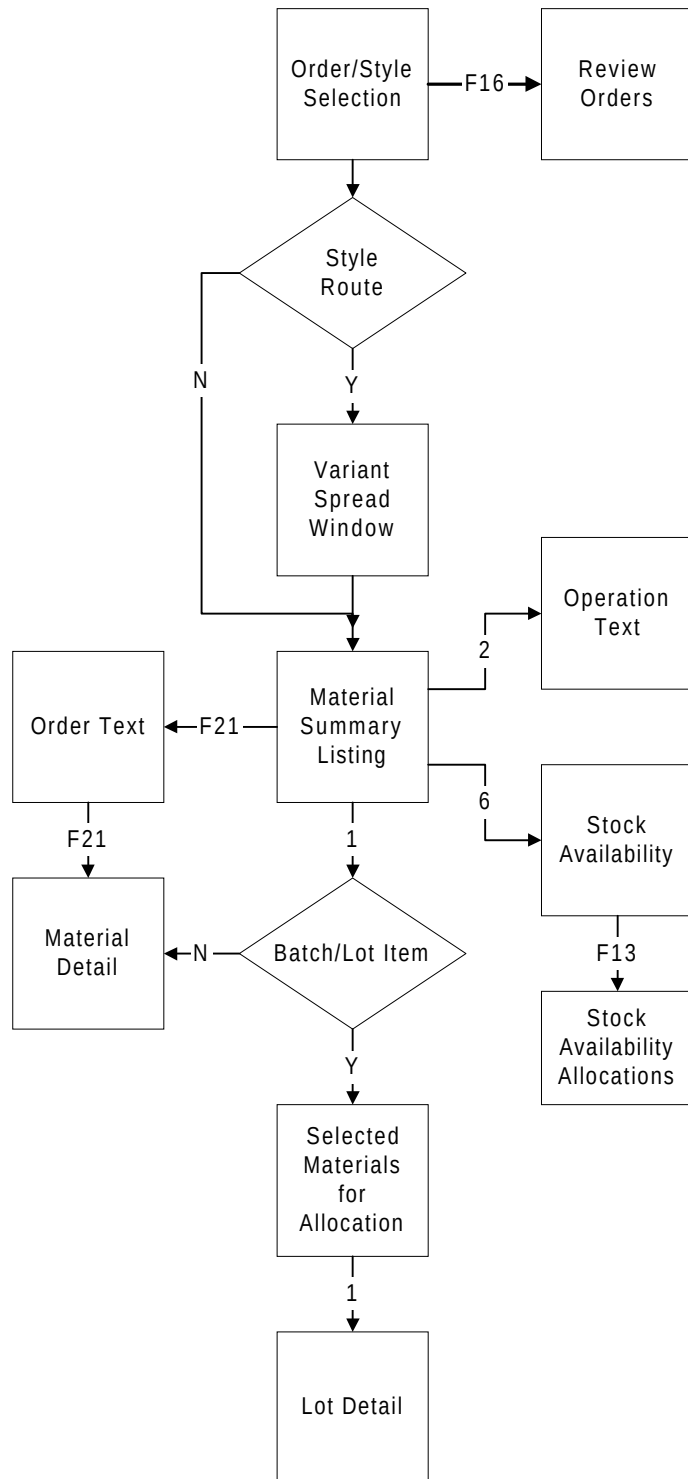

Figure -: Order Release Functionality

This figure provides a route map to the various screens and windows available within Order Release. The boxes indicate the relevant function. Fn indicates a numbered function key on the calling screen. N on a line indicates the Option number which may be entered against a line.

Production Order Release Screen 1

Select Release Orders on the menu to display
Production Order Release screen 1.

Fields:

Production Order

This field enables you to:

- Release a specific order. Enter the order number.
- Select from a range of orders. Leave this field blank, set your selection parameters and press **F16**.

Or Select BY

The following fields constitute search criteria for an order review. The fields may be used independently.

Style

Enter a style code.

Reference

An entry limits the selection to those orders that match entries made in the Reference 1 field on the order header.

Orders Due Range

Limits orders to those with a due date after that entered in the Due From field, but prior to the date entered in the To field.

Functions:

F16

Identifies orders in accordance with entered parameters and displays them in a window for selection.

Production Order Release Screen 2

Press **Enter** on Production Order Release screen 1 to display Production Order Release screen 2.

F3=Exit F8=Release Order F12=Previous F17=Amend Order F18=Mat. Avail. F21=Text F24=Prod Distribution 18-42 MW KS IM II KENB20A PET166S2					

Fields:

Order Priority

This priority code is passed down to the operations and is used to sequence production at machines. The value must be in the range 0 to 9 inclusive, with 0 having the highest priority.

The default value of this field is set by the Order Priority Default flag on the Company Profile.

Print Documentation

This field determines whether or not order documentation is to be printed when the order is released. Documentation can be printed separately using the Print Order Documentation facility.

There are various flags on the Company Profile that affect the order documentation printed, and the default value of this field:

- The Print Documentation at Confirmation/Release flag determines the default value of this field
- The Issuing/Printing Interactive or Batch flag specifies whether the documentation is printed interactively or is submitted as a batch job when releasing the order.
 - If the flag is set to 1 (interactive) the documentation is printed immediately which may cause some delay before control is returned

to the operator, as no further processing can be actioned until the print has completed.

- If the flag is set to 0 (batch) the printing is submitted as a batch job minimising the delay as control is returned immediately to the operator following submission.
- The Print Operations on Production Order flag determines whether or not each operation is printed on the production order.
- The Print Operation Text flag determines whether or not any additional text held against operations is printed on the production order.
- The Print Pick Lists flag indicates whether or not materials are included on the order print.
- The Suppress Backflush Items on Pick List & Production Order flag indicates whether or not bulk issue (backflush) items should be printed on production orders
- The Suppress Warehouse Items on Pick Lists & Production Order indicates whether or not warehouse controlled items are to be listed on production orders. This flag does not affect pick lists produced by the Warehousing application

Issue Materials

The option is given to issue materials to the first or all operations automatically; or to not issue materials at all.

The default value of this field is set on the Materials to be Issued at Order Release flag on the Company Profile.

For non lot controlled items, a warning message is displayed if the issue would result in, or increase, negative stock; confirmation of issue is then required.

Lot controlled items are issued in FIFO style until stock is exhausted when issue will cease.

Floor stock items are transferred directly to the floor stock location.

Auto Bundle Create

This prompt will only be displayed if the Automatic Bundle Creation at Order Release flag on the Company Profile is set to enabled; the default value set there will also be displayed here. It allows you to create and print bundle tickets automatically when the order is released. Bundle tickets may be created for the first or all stages.

Create Warehouse Requirements

Enter one of the following:

0 - Create material requirements for warehouse controlled materials automatically at order release.

1 - Use the Generate Warehouse Requirements option at a later date to create material requirements for warehouse controlled materials.

The default value for this field is set in the Warehouse Issue Requirements at Release field on Maintain Company Profile screen 4.

Functions:

F8

Actions the release procedure.

F17

Accesses the Order Maintenance function and allows you to make changes to the order. The initial screen displayed is the order header.

F18

Accesses the Material Availability Enquiry function and allows you to allocate material lots manually, and perform a trial allocation for the order. You may want to do this for example, if you want to ensure that there are enough materials in stock to complete the order before releasing it.

F21

Enables you to add text associated with the order release point

F24

Displays the variant spread associated with the order

System Updates:

On update:

- A transaction with an activity type of STATUP (order status update) and a transaction type of 51 (change production order status) is generated
- If materials are issued, a transaction with an activity type of WOMISS (issue to production order) and a reporting type of 02 (issue to production order) is generated
- If any materials with a Material Control Policy of 3 (issue to floor stock) are issued, a transaction with an activity type of FLORIS (issue to floor stock) and a reporting type of 10 (issue to floor stock) is generated

Production Order Release Screen 3 (F16)

Select **F16** on Production Order Release screen 1 to display Production Order Release screen 3.

This screen enables you to review orders that may be selected for release. You can also review stock availability, update text, and select a range of one or more orders to release. This screen includes those orders that fall within the parameters set on the selection screen. Column codes are TP (order type, which will always be 1), RT (route) and Prod/Stage (production stage) set on the order header.

Fields:

O(Ptions)

- 1 - Display a detailed material enquiry.
- 2 - Display operational text. An asterisk (*) adjacent to the Options field indicates that operation text has been entered.
- 5 - Allocate material lots. This is only applicable to lot controlled items.
- 6 - Review stock availability for the material.

(Insufficient Stock Flag)

'**' - Indicates that there is not enough stock to meet the requirements. The quantity available is shown as a negative stock balance.

(Lot Flag)

'L' - Indicates that the item is lot controlled.

Functions:

F17

Temporarily allocate materials for the duration of the enquiry. This enables you to check the material availability for a range of orders in order to ascertain the feasibility of multiple order release.

On allocation, the system will return to the selection parameters screen to enable you to enter a new order or style. Allocation details will then be updated and displayed against the next material enquiry as the Trial Kit Qty

F21

Display any existing order text

Material Availability Enquiry With Allocation Screen 2 (Option 1)

Option 1 against a non batch/lot controlled material on the Material Summary Listing displays this screen.

This screen displays the stock situation for a selected material and is divided into three sections:

- The top section displays details of the order or route selected
- The middle section displays details of the material itself, the operation at which it is required, and the quantity required
- The bottom section details the stockroom balances, together with any quantity allocated during this session

The stockroom is the issuing stockroom only.

Selected Materials For Allocation Window (Option 1)

Option 1 against batch/lot controlled materials on the on the Material Summary Listing screen displays this screen.

This screen displays, for selected materials, the required and allocated quantities. It additionally shows, for each 'summary' lot number of the material, the allocated and available quantities.

A 'summary' lot number is determined by the setting on the Parameter file for the Production Stage attached to the order. The 'summary' lot number is in essence an accumulation of actual lot numbers where the first n characters are the same. The value of n is held on the Parameter file against type VPOL, code=Production Stage of order.

Fields:

Select

Enter 5 to allocate the total available quantity of the lot to the order. This will reduce the available quantity of the lot to zero and increase the quantity allocated of the material by the original available quantity of the lot.

Allocated

Enter the quantity of the lot to be allocated to the order. This will update both the quantity allocated of the material and the quantity available of the lot.

Functions:

F8

Writes all the allocation records

Generate Warehouse Requirements

3/P4M

From this option, you can request warehouse materials to be issued from either a single warehouse or a range of warehouses.

You can request warehouse requirements automatically at order release. For more information, refer to the Release Orders option. However, the Generate Warehouse Requirements option may be more convenient than issuing the materials automatically at order release from the Release Orders option. Two examples are listed below:

- If long operation times are involved, you can avoid materials moving to the marshalling area before they are required on the production order.
- You can avoid allocating materials exclusively to one order when, in practice, the materials should be shared between all orders ready to consume them.

From this option, you can alter the quantity recommended to reflect the real issue units from the warehouse, ie require 30 buttons, issue a box of 200, return 170 to the warehouse.

Generating warehouse requirements creates a stock allocation in the warehouse stockroom.

Note: This option is only accessible if Warehousing is live.

Processing The Requirements Within Warehousing

To process the requirements generated by this option, you need to carry out the following from Warehousing:

1. Print a pick list.
2. Confirm picking.
3. Confirm issue for production.

For more information, refer to the section titled Issuing Materials From A Warehouse.

Generate Warehouse Requirements Screen

To display this screen, select Generate Warehouse Requirements from the menu.

From this screen, enter selection data to determine which production orders and material requirements you can process from the Create Material Requirements screen.

(Blank or zero implies from start)		(Blank or zero implies to end)	
Include zero balances.. @ (0=No 1=Yes)			
Apply warehouse rules when no lot allocations exist?... @ (0=No 1=Yes)			
F3=Exit F4=Prompt			
MA	a	06/027	

Fields:

From/To Warehouse

Enter a range of warehouses for material issue.

From/To Finished Item

Enter a range of styles.

From/To Reference

Enter a range of references. This is the reference that you can enter optionally when creating/maintaining a production order in the Reference 1 field on Production Order Maintenance screen 2.

From/To Op. Start Date

Enter a range of dates containing the start dates of the operations for which you wish to review material requirements.

From/To Order

Enter a range of production orders.

From/To Operation

Enter a range of operations.

Include Zero Balances

This field determines whether the next screen (that is, the Create Material Requirements screen) displays materials for which demand has been fully satisfied.

Enter one of the following:

0 - No. Do not display materials with a zero balance.

1 - Yes. Display all materials, regardless of whether or not there is an outstanding material requirement. Select this option to generate unplanned requirements.

Apply Warehouse Rules When No Lot Allocations Exist?

For each material that has no lot allocations, this field sets the default value of the Use Whs field on the Create Material Requirements screen. The value in the Use Whs field determines whether to use warehouse rules in deciding which lots to pick. From the Create Material Requirements screen, you can override this value for individual materials.

Enter one of the following:

0 - No. Do not use warehouse rules. If lot allocations do not exist, then material requirements are not generated.

1 - Yes. To determine which lots to pick, use warehouse rules. You must have set up these rules already from the Item/Warehouse Profile option in Warehousing.

To display the Create Material Requirements screen, press **Enter** from this screen.

Create Material Requirements Screen

To display this screen, press **Enter** from the Generate Warehouse Requirements screen.

The screen displays the materials that match the selection criteria you entered on the Generate Warehouse Requirements screen. The screen displays the materials in a list of production orders that have outstanding warehouse controlled material requirements that are awaiting allocation.

Once accepted, no further extraction for an order line can be carried out until stock has been issued to this line from Warehousing.

If no materials match the selection criteria on the Generate Warehouse Requirements screen, then a message displays to explaining why no materials match.

Fields:

(Untitled)

Select. Enter one of the following:

1 - Process. Generates warehouse requirements for the material.

5 - Issue Requirements. Opens the Issue Requirement Details window from which you can review whether any material requests have been made already and whether these are issued.

Order / Fin.Item

This field displays, for your information only, the production order number and the finished style.

S

This field displays, for your information only, the status of the material. The field has one of the following values:

- 1 - Created.
- 2 - Confirmed.
- 3 - Released.
- 4 - Active.
- 8 - Completed.

Opsq

This field displays, for your information only, the operation sequence number of the operation that requires the material.

Wh

Warehouse. This field displays, for your information only, the warehouse that controls the material.

Start/Reference

This field displays, for your information only, the start date of the operation for which the material is required.

Component / Description

This field displays, for your information only, the material code and description.

Lot

This field displays, for your information only, a lot description for lot-controlled materials only.

Conf. Qty

Confirmed Quantity. This field defaults to the quantity that has not yet been generated.

If you do not wish to fully meet this requirement, enter a smaller quantity. If the material is unallocated, you can also exceed the default quantity.

Use Whs

Use Warehouse. Use this field to specify whether to use warehouse rules in making a decision about which lots to pick.

Enter one of the following:

- 0 - No. Do not use warehouse rules. Material requirements will not be generated.
- 1 - Yes. Use warehouse rules to generate material requirements.

Note: If lot allocations exist for a material, then this field is not available.

Functions:

F8

Update and Submit Job. Submit a batch job to generate warehouse requirements for materials.

Select required items and **F8** to submit job.

Issue Requirement Details Window (option 5)

To open this window, enter 5 in the Select field on the Create Material Requirements screen.

This window displays the material requests you have generated already and indicates whether these are issued.

Manual Bundle Creation

4/P4M

Use this option to create bundles and bundle tickets for a selected production order.

You can select a production order and an operation or a lot number for bundling.

A colour/size matrix display allows you to enter a bundle quantity and the number of bundles per colour/size or colour only or size only.

All operations after the bundle up operation, up to the next bundle up operation, are released for the bundle quantity. This includes any parallel operations.

Bundle records are created for each bundle ticket type, including parallel, for example, fronts, backs and sleeves

You can print the bundle tickets (bar-coded) either interactively, bundle by bundle, or in batch when all batches have been defined, depending on the setting of the Bundle Creation Method flag on the Company Profile.

The following restrictions apply:

- You can only record bundling at pre-defined operations on an order.
- The total quantity must not exceed the completed quantity at the previous operation.

Note: This option is only accessible if the Bundle Creation Method flag on the Company Profile is set to 1 (manual).

Select Manual Bundle Creation on the menu to display Manual Bundle Creation screen 1.

Manual Bundle Creation Screen 1

Select Manual Bundle Creation on the menu to display Manual Bundle Creation screen 1.

Manual Bundle Creation			
Order.....?..	█		
Operation.....?..			
Lot Number.....?..			
F3=Exit F4=Prompt			
05-20	SA	MW	KS IM II KENB20A PET166S2

Fields:

Order

Enter the appropriate production order number. This must be a valid order number with a status of either 'Released' or 'Active'.

Operation

If on entry this field is left blank, and within the route of the selected order number there is only one bundle up operation, then the operation number is defaulted to and displayed automatically. If however, there are multiple bundle up operations on the order route selected and the field is left blank, then the Available Bundle Up Operations field is displayed. If entered it must exist on the selected order and be a bundle up operation.

Lot Number

If the WIP Lot Tracking flag on the 'live' Organisational Model is set to 1 (yes) and the style on the production order is lot controlled, then a valid entry must be made in this field. before any further processing can take place. If the flag is set to 0 (no) then no validation routines are run.

Manual Bundle Creation Screen 2

This function enables the manual creation of bundles by entering the quantity in a bundle, numbers of those bundles against a colour or size or colour/size.

- The matrix shape is determined by the bundle-up details entered for the operations reporting level.
- Reporting level 1 (style/colour), a colour axis with size as a single column with no heading is displayed.
- Reporting level 2 (style/size), a size axis with colour as a single row with no heading is displayed.
- Reporting level 3 (style/colour/size), a full matrix with all valid combinations of colour and size as defined on the route for that production order is displayed.

This window is opened following entry of a production order, operation and lot number (where applicable) on the Manual Bundle Creation screen 1.

11-32	SA	MW	KS IM II KENB20A PET166S2

Fields:

Outstanding Quantity

System maintained field; the quantity displayed is the total quantity available for bundling up on this production order for the operation/lot number.

It is equal to the total of all individual available quantities at the style/colour, style/size or style/colour/size level. The quantities of all bundles created within the function will reduce this quantity.

Bundles Created This Session

System maintained field; starts at zero on opening the window and reflects the number of bundles created within this session as they are created.

Bundles

Enter the number of bundles to be created for the quantity entered below. If left blank and a quantity per bundle is entered below, then the system will assume that one bundle is to be created.

Qty Per

Enter the quantity of each bundle to be created. If an entry has been made in the Number of Bundles field, then a quantity must be entered in this field.

Functions:

F7

Displays the Bundle Creation Review screen

F8

Submit bundle creation. This creates all the bundles via the Transaction Manager as a background job.

A bundle summary record is created for each bundle ticket type within the operations released. The next available bundle number in the range 00000001 to 99999999 is selected, incrementing by 1 for each bundle summary created.

Processing will also trigger the bundle printing function.

F9

Displays quantities available for bundling at this operation in the relevant matrix format.

F17

Enables the booking of scrap quantities.

F18

Enables the booking of held quantities.

Bundle Creation Review Window

This window displays the bundles that have been entered, but not yet created. It shows the colour and/or size codes and descriptions for each bundle awaiting to be created displayed in colour and size code sequence, not the sequence of entry.

F7 on the Manual Bundle Creation, Bundle Quantity Entry screen opens this window.

```

Fields:

S(Elect)

Enter a 1 to return to the calling screen.

Automatic Bundle Creation

5/P4M

Use this option to release automatically all available quantities of product at the bundle up operation. You can use this option if you always use the same bundle sizing rules to create bundles.

You can select by production order and operation number.

If there is more than one bundle up operation on the route, you can release either the first bundle on the route only or all bundles.

Bundle records are created for each bundle ticket.

You may print bundle tickets interactively or in batch. You can reprint bundle tickets.

If called from Release Orders (2/P4M), this option releases all operations between bundle up points, including bundled and non bundle controlled operations.

Note: This option is only accessible if the Bundle Creation Method flag on the Company Profile is set to 2 (automatic).

Select Automatic Bundle Creation on the menu to display the Automatic Bundle Creation screen.

Enter 1 in the Auto Bundle Create field on Production Order Release screen 2 (option 2/P4M) to display the Automatic Bundle Creation screen.

Lot Number...?.. ☐

Create Bundles for 2 (1=Selected Bundle Up Stage only)
(2=All Bundle Up Stages)

F3=Exit F4=Prompt F8=Submit

05-19 ☐ MW KS IM II KENB20A PET166S2

Fields:

Order

Enter the relevant production order number.

Operation

If, on entry, this field is left blank and within the route of the selected order number there is only one bundle up operation, then the operation number is defaulted to and displayed automatically.

If however, there are multiple bundle up operations on the order route selected and the field is left blank, then the Available Bundle Up Operations field is displayed.

If entered it must exist on the selected order and be a bundle up operation.

Lot Number

If the WIP Lot Tracking flag on the 'live' Organisational Model is set to 1 (yes) and the style on the production order is lot controlled, then a valid entry must be made on this field before any further processing can take place. If the flag is set to 0 (no) then no validation routines are run.

Create Bundles For

This field governs how many of the bundle up operations on the chosen production order will have bundle tickets produced; and defaults to the setting of the Automatic Bundle Tracking Creation at Order Release flag on the Company Profile that may be set to 1 (first stage) or 2 (all stages).

Press **Enter** on the Automatic Bundle Creation screen to create the bundles.

System Updates:

A bundle summary record is created using the rules of the bundle ticket type related to the operations following the bundle up operation. Rules for bundle default quantity, bundle quantity variance and last bundle policy will determine the size of each bundle.

If called via Automatic Bundle Creation, the quantities available to be bundled are physical WIP balances at the operation prior to the bundle up operation less any bundles already created.

Depending on the screen option chosen, either bundles for the first bundle up stage or all bundle up stages are created. If all stages are chosen, then bundles for the order quantity are created.

If called via Release Order, the quantities available to be bundled are the production order quantities.

Processing calls the Bundle Print function as described in Print Order Documentation.

Print Order Documentation

6/P4M

Use this option to print or reprint order documentation manually for selected orders. If a production order is linked to one or more sales orders, then the printed documentation shows the associated sales orders.

Documentation may already have been printed as part of the confirmation or release procedures; or as a consequence of creating bundle tickets.

Note: The Issuing / Printing Interactive or Batch flag specifies whether the documentation is printed interactively or is submitted as a batch job.

Select Print Order Documentation on the menu to display the Shop Documentation Order Selection screen.

```

Colour

Enter in the new colour for the bundle. This must be a valid colour for the production order.

Size

Enter in the new size for the bundle. This must be a valid size for the production order.

Order Completion

8/P4M

Use this option to:

- Change the status of Released orders to Complete.
- Change the status of Active orders to Complete.
- Cancel a Released order.
- Mark up a completed quantity on an operation as over or short.
- Close or re-open selected operations.
- View and amend any text associated with the order or any of its operations.

Note: If MRP is on-line and the Order Maintenance reason code is active, completing a production order can generate a trigger for the next MRP run for any MRP materials on the order that have an issue quantity less than the required quantity (ie not all the material has been consumed). For more information about reason codes, please refer to Net Change Reason Codes in Style Production Planning.

Note: If Warehousing is 'live', then there must be no outstanding pick requests for warehouse controlled materials to the order.

Back To Back Orders

If you complete a production order with the reserved quantity still outstanding, this program displays a warning and reports the action on the demand exceptions report.

This program gives a warning if any of the following conditions are met:

- A sales order attached to the production order is a quote.
- A sales order attached to the production order has been cancelled or suspended.
- A line reserved for an attached sales order is cancelled.

You can override the warning.

Completing An Operation Over Or Short

This function allows you to complete an operation where the total quantity booked over all transactions is either over or short. It is assumed that any held quantity will be released and is therefore included in the new planned production order quantity. For example:

Planned quantity: 100

Operation: Complete: 60

Operation: Held: +20

New PO planned quantity: 80

Rework activities are ignored.

When an operation is completed over or short and the quantity adjustment conditions are met, Style automatically updates planned production order quantities and recalculates durations and work station loadings. The adjustments take account of:

- Wastage on both material and operations.
- Sales order reservations on production orders.
- Raw material allocations on inventory and lot inventory.

Material Cost Recovery Variance Report

At production order completion, this option prints automatically a Material Cost Recovery Variance Report for FIFO costed styles. The Costing Method for the style must be set to F, indicating FIFO costed, on Product Maintenance screen 5. In addition, the FIFO Receipt Costing Method must be set to 1 on Maintain Company Profile screen 4.

The report shows:

- Planned order and receipt quantities for the style and its outputs.
- Planned, issued and recovered quantities for each material.
- Material costs for the quantities above with issued versus recovered cost variance.

The report values for each material are calculated thus:

Planned The material requirements.
Quantity

Issued Quantity The quantity issued.

Recovered If the production order was over-
Quantity manufactured, then the material
 quantity issued is shown here.

 If the production order was under-
 manufactured or made according to
 plan, then the quantity of material that
 is assumed used based on the
 production order and material
 requirements quantities is shown here.

Planned Cost The total standard cost for the material
 requirements.

Issued Cost The total movements cost for all issues
 against the material using the costing
 method to determine which type of
 costs to use.

Recovered Cost The material cost according to the costing method based on the Recovered Quantity given above.

Variance Cost $(\text{Issued Cost}) - (\text{Recovered Cost})$

Fields:

O

Option. This field enables you to determine the status of an operation, or mark an operation for text amendment or entry.

1 - Complete Operation. Close an operation that is currently Released or Active. The status of the operation changes to 8 (complete) and the outstanding quantity sets to zero.

Note: If the following conditions are met, then the quantity completed is marked as Over or Short as appropriate:

- 1. The quantity completed has been entered already through a transaction booking (see options 2/P4T, 4/P4T 7/P4T, 8/P4T).*
- 2. The operation is marked as one that requires production order adjustments. This is achieved by setting the Operation Type for this operation to 8 on the Additional Operation Values window in the Style Definition Management application (option 11/P1M).*
- 3. The quantity completed falls outside the complete tolerances given in the CTOL parameter. The calculation assumes that any quantity held will be released and therefore included in the new planned production order quantity. To find out more about the CTOL parameter, refer to the Style Definition Management application (option 2/P1U).*

If the Operation Type for this operation is not set to 8, then you can still mark the quantity completed as over or short by selecting option 8 in the Option field.

Marking the quantity completed as over or short has the effect of recalculating durations, allocations, reservations, material requirements and machine loading.

This may be done on both planned and unplanned complete short/over operations.

Note: Completing an operation sets the quantity outstanding to zero but does not alter the quantity completed.

2 - Re-open Operation. Change the status of the operation back to its status before completion. Only 'Completed' operations can be re-opened.

Note: Re-opening an operation restores the quantity outstanding to the quantity scheduled minus the quantity completed.

3 - Text. Review operation text.

8 - Complete Short/Over. You can mark an operation as over or short when the following conditions are met:

- The Reporting Level for the operation is set to the highest level possible for the style's dimensions. This field is set up on the Primary Operation

Maintenance screen under route maintenance in Style Definition Management (option 11/P1M).

- The Reporting Type for the operation is set to 0 or 1. This field is set up on the Primary Operation Maintenance screen under route maintenance in Style Definition Management (option 11/P1M).
- The quantity completed has been entered already through a transaction booking (see options 2/P4T, 4/P4T 7/P4T, 8/P4T).
- The quantity completed falls outside the complete tolerances given in the CTOL parameter. The calculation assumes that any quantity held will be released and therefore included in the new planned production order quantity. To find out more about the CTOL parameter, refer to the Style Definition Management application (option 2/P1U).

Functions:

F8

Complete Order. Set the order status to 'Complete'.

F11

Set the order status to 'Cancelled'. It cannot be re-activated. Only 'Released' orders can be cancelled.

Note: When you cancel a production order, this program deletes any reservations for attached sales orders and reports the action on the demand exception report. You should go into sales order amend to set up another back to back production order against the sales order.

F12

Re-select Order. Select a new order number.

F13

Set the order status to 'Released' or 'Active'. If used in conjunction with Option 2, then only the selected and all those following operations are re-opened. If a 2 has not been entered, then all operations are re-opened.

F14

Products. Display the status of each variant on the order.

F17

Reservations. Display the sales orders reserved against the production order. This function is only available if the selected production order is linked to one or more sales orders.

F19

Additional Qtys. For each operation, view a second line of detail that includes the quantities that have been reworked, held and scrapped and the original planned production order quantity.

F21

Text. This function is displayed in reverse video if text exists.

F22

Bundles. Review associated bundle details.

Order Outputs Status Window (F14)

The window shows the ordered, received and outstanding quantities for all variants on the order.

Select **F14=Products** on Production Order Completion screen 3 to display the Order Outputs Status window.

Fields:

(Untitled)

Option. You can enter the following options:

5 - Order Progress. Display the progress of the selected variant on the production order.

Functions:

F5

Refresh.

F22

Expand. View the original quantity ordered for the variant. The F22 key acts as a toggle.

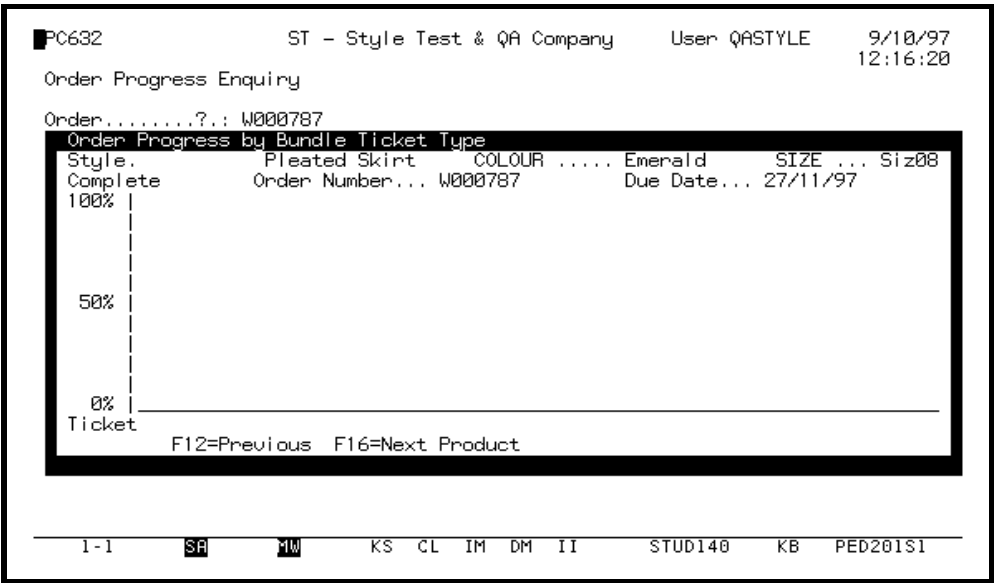

Enter 5 in the Option field on the Order Outputs Status window to display the Order Progress by Bundle Ticket Type window.

Order Progress by Bundle Ticket Type Window (Option 5)

This window displays the progress of the selected variant on the production order.

Enter 5 in the Option field on the Order Outputs Status window to display the Order Progress by Bundle Ticket Type window.

Fields:

###

Indicates that this percentage of the variant has been completed.

“”

Indicates the percentage of this variant that is available for production.

Bundle Review Window (F22)

Use this window to:

- List all bundles for the production order.
 - Set the status of a bundle to 'Complete'.
 - Re-open a closed bundle.
-  Select **F22=Bundle Review** on Production Order Completion screen 3 to display the Bundle Review window.
