Chapter 2

Production Order Transactions

Material And Lot Allocation

Style uses allocations to make inventory reservations for production orders. You can issue any material to any production order.

Material Allocation

Material allocation helps you to track demand of material within stock inventory. An allocation shows the quantity of an item allocated either to customer or production orders.

Style holds allocations at four levels:

1. All material is individually allocated.
2. The sum of allocations for a particular material is held within stock inventory for the material/stockroom.
3. An allocation for lot-controlled material is held as a lot allocation and the sum is held within lot inventory for the lot/stockroom.
4. Changes to the material allocations are reflected automatically in stock inventory. Changes to the lot allocations are reflected automatically in lot inventory.

From allocations, you can calculate available quantity.

For materials on production orders, Style holds allocations in three places:

- Against material used on a production order (as in the Order Enquiry option).
- Within stock inventory (as in the Full Stock Position Enquiry).
- Within lot inventory (as in Part/Stockroom Enquiry).

You can arrange to allocate materials automatically from the issuing stockroom, either at order confirmation or order release. When you allocate materials automatically, the allocated quantity within stock inventory increases automatically.

The allocated quantity decreases when one of the following events occurs:

- Materials are issued onto the shopfloor.
- The production order is marked as complete.
- The material is marked as complete.

Lot Allocation

You can change allocations for lot-controlled inventory following production order confirmation and before or after production order release.

To change lot-controlled allocations, use the Material Availability option. Alternatively, you can access the Material Availability function from the Release Orders option.

The allocations made at this stage may differ from the original stock allocations made. The sum of lot allocations is reflected within stock inventory at stockroom level where it exceeds the material requirements.

If the sum of the allocated lot quantity is lower or the same than the material required, then no change is made to the material's allocated quantity where it already exists. This is because the quantity required is still the minimum amount of material to be issued on the production order. Typically, this situation may occur when not all the material has arrived from the supplier

Material Required	Material Allocated	Prod Order Lots Allocated	Stock Inventory Allocation	Lot Inventory Allocation
100	100	80	+100	+80

However, if the allocated quantity is greater than the material required, stock inventory reflects the over-allocation.

Material Required	Material Allocated	Prod Order Lots Allocated	Stock Inventory Allocation	Lot Inventory Allocation
100	120	120	+120	+120

Production Order Amend

After allocation, you can amend a production order.

If you change material requirements, then:

- Allocations need to be brought back in line.
- Stock inventory must also change to reflect a change to allocations.
- Lot allocations and lot inventory remain unchanged.

	Material Required	Material Allocated	Prod Order Lots Allocated	Stock Inventory Allocation	Lot Inventory Allocation
Before	100	120	120	+100	+120
After	150	150	120	+50	+0

Production Order Release

To arrange for automatic allocation at order release, set the Allocation Of Materials At indicator on Maintain Company Profile screen 4 profile to 2. The allocated quantity for each material is set to the material requirements.

Prior to release, you may change allocations by amending the production order or adding, amending and deleting lot allocations. To amend the production order, select **F17=Amend Order** from Production Order Release screen 2. To change lot allocations, select **F18=Mat. Avail.** from the same screen.

Material issues may also occur for either the first or all operations. Allocations will decrease in line with the quantities issued. Lot allocations reduced to zero are deleted.

Material Issue

There are two ways of issuing non-backflush material from the raw material stockroom:

- During the release of the production order via the Release Orders option.
- Through the Issue Materials option.

Floorstock and subcontract materials transfer to the floorstock or subcontract stockrooms respectively.

At this stage, all standard issues decrease the material's allocation as the issue quantity increases. Thus, the allocated quantity on the material always reflects that portion of stock inventory allocated to the material. This is done regardless of whether the material is stock or lot controlled.

	Material Required	Material Issued	Material Allocated	Prod Order Lots Allocated	Stock Inventory Allocation & Physical	Lot Inventory Allocation & Physical
non lot	100	80	20		-80	
lot	100	80	20	0	-80	0

Where an over-issue occurs, the allocated quantity reduces down to zero.

	Material Required	Material Issued	Material Allocated	Prod Order Lots Allocated	Stock Inventory Allocation & Physical	Lot Inventory Allocation & Physical
non lot	100	120	0		-100	
lot	100	120	0	0	-100	-100

Floorstock and subcontract material is treated in a slightly different manner. As the material in these cases transfers to another stockroom, the allocated quantity remains in place and transfers to the floorstock or subcontract stockroom in the stock inventory. Likewise, any lot allocations also transfer and may split where there is only a partial transfer of material.

	Material Required	Material Issued	Material Allocated	Prod Order Lots Allocated	From Stock-room Allocation & Physical	To Stock-room Allocation & Physical	Lot Inventory Allocation
non lot	100	80	100		-80	+80	
lot	100	80	120	40 & 80	-80	+80	+0

Backflush material is not issued until booking are made and therefore allocations remain unchanged at this stage.

Negative issues increase the allocated quantity as the issued quantity decreases on non-backflush, floorstock and subcontract materials.

Material Completion

Over issues occur when more materials are allocated than are actually needed. In this case, the allocated stock is brought down to zero. However, under issues cause free stock to remain allocated in the system, thereby portraying a misleading picture of the true nature of demand on the inventory.

To deallocate materials prior to production order completion, use Complete Materials indicator on the Issue Materials screen and **F14=Deallocate** on Record Issues And Adjustments screen 1, via the Issue Materials option.

The result of the de-allocation is that all remaining material allocations are set to zeros and stock inventory adjusted accordingly.

	Material Required	Material Issued	Material Allocated	Prod Order Lots Allocated	Stock Inventory Allocation	Lot Inventory Allocation
non lot	100	80	0		-20	
lot	100	80	0	0	-20	-20

Any remaining lots are deleted also with a warning that lot deallocation is to occur.

You can use the Complete Materials indicator to reallocated material also.

Lot allocation is a purely manual process. If lot material exists on the production order requiring re-allocation and lot allocation is not done prior to the re-allocation process, then lot-controlled materials are treated as ordinary stock.

	Material Required	Material Issued	Material Allocated	Prod Order Lots Allocated	Stock Inventory Allocation	Lot Inventory Allocation
Non Lot						
Before deallocation	100	80	20		20	
After deallocation	100	80	0		-20	
After reallocation	100	80	20		+20	

tion						
Lot						
Before deallocation	100	80	120	120	120	120
After deallocation	100	80	0	0	-120	
After reallocation	100	80	20	0	+20	0

Complete Operation Short/Over

Completing an operation short or over causes production order and material quantities to be changed for all operations following the selected operation. Here, the material allocations are brought in line with the new planned quantities taking quantities issued into account. Any lots allocated to the production order should be re-allocated manually.

Production Order Completion

On production order completion, outstanding balances against materials on the production order are deallocated on stock and lot inventory.

	Material Requi- red	Material Issued	Material Alloca- ted	Prod Order Lots Alloca- ted	Stock Inventory Allocation	Lot Inventory Allocation
Non Lot	100	80	0		0	
Lot	100	80	0	0	0	0

As with re-allocation at point of issue, the re-allocation which occurs when a production order is re-opened can only be done at stock and not lot inventory level. Therefore, lots should be manually allocated.

Issue Materials

Use this option to issue material on one order or a range of orders. Such orders may be:

- 'First time' issues for orders not automatically actioned as part of the order release procedure. This may be for the whole order, or for all operations other than the first operation that was issued at release.
- Lot controlled items that were out of stock at the time of the automatic issue request.
- Additional sundry issues.
- Substitute material issue.

You can issue material to an operation on a production order or to a machine that is not defined on the route. You can include subcontract operations.

Each issue is recorded against a default reference, transaction type and date; however, an override facility is provided to record a reference and transaction type against each item if required.

Note: When more materials are issued than the required quantity, the available stock for these items changes. To compensate, if MRP is on-line and the Unplanned Issues and Receipts reason code is active, a trigger is created for the next MRP run.

For more information about the Unplanned Issues and Receipts reason code, refer to Net Change Reason Codes in Style Production Planning.

Issue Materials Screen

Select Issue Materials on the menu to display the Issue Materials screen.

Use this screen to issue materials from stores (ie stockrooms) to a production order. Enter a production order number. Alternatively, search for an order by entering selection criteria (ie style, reference and/or order due date).

From this screen, you can gain access to other screens that allow you to review outstanding issues and identify and issue substitute materials.

MA	a	MW	05/027

Fields:

Production Order

The function of this field depends on how you want to use the facility:

To issue to a specific order, enter the order number

To select from a range of orders, leave this field blank, set your selection parameters and press **F16=Review Orders**.

Operation Sequence

Enter a specific operation if issues are to be restricted to one operation. Leave blank to include all operations.

Date

Enter the date on which issues are to be made. The system defaults to the current date.

Machine

This field enables you to record material issues to machines other than those defined on a route. If no machine is entered, the system assumes the machine entered on the route.

Shift

Enter a specific shift within the shift profile defined for the machine on the route during which the issues are to be made; or the override machine entered on this screen.

Complete Materials

Enter one of the following:

0 or blank - No. Do not complete or re-open material allocations.

1 - Complete. Complete or deallocate the material. A warning informs you that deallocation is to occur.

2 - Reopen. Reopen or reallocate the material.

Warning: If you are reallocating unused material, lots previously deleted during material completion will not be reallocated automatically.

Note: Material may be allocated over more than one stockroom. This may occur in the case of sub-contract or floorstock materials that may have been transferred to another stockroom but have not yet been issued.

Style

Enter a style code.

Reference

An entry limits the selection to those orders that match entries made in the Reference 1 field on the order header.

Orders Due Range

Limits the orders selected to those with a due date after that entered in the Due From field, but prior to the date entered in the To field.

Complete Materials

Enter one of the following:

0 or blank - Do not complete or reopen.

1 - Complete. Mark the issue of materials as complete. If appropriate, Style deallocates materials.

2 - Reopen. Reopen a materials issue that you have previously marked as complete. This allows you to adjust the allocation of materials.

Functions:

F16

Review orders

Record Issues And Adjustments Screen 1

Enter a production order number in the Production Order field on the Issue Materials screen to display Record Issues And Adjustments Screen 1.

This screen shows the current status of material issues against a specific production order.

You can use this screen to carry out material issues. Style allocates material and adjusts stock inventory.

If you mark the issue as complete (ie set Complete Materials to 1 on the Issue Materials screen), Style deallocates or reallocates material, as appropriate.

If you set Complete Materials to 2 (ie Reopen), you can use this screen to deallocate material that you have already issued. You can also reallocate material without carrying out a material issue.

For deallocations, Style deletes any lot allocations and adjusts stock and lot inventory.

Warning: Before carrying out a reallocation, make sure that you carry out any lot allocations. Otherwise, Style treats lot-controlled materials as ordinary stock.

F12=Previous F19=Record Unplanned Issue F22=Expand/Contract

10-02 **S** MW KS IM II KENB20A PET166S2

Fields:

S

Select. Enter one of the following:

1 - Select. Action a selective issue via **F9=Confirm Selected Issues**. You may select multiple materials.

2 - Substitutes. Review alternative materials that can be used as a substitute.

Issue Qty

Displays the quantity required to complete the order or operation. If blank, then all current requirements are met. A rider on this is that backflushed materials have not been issued but show a zero requirement as the requirement is met automatically on receipt of a parent item at count points. If an item is to be substituted, then a quantity must be specified before the substitution routine is invoked. It is not possible however, to substitute more than has been issued.

To make an adjustment indicating a return to stock, enter a negative quantity. To do this, enter a quantity with a minus sign suffix, not prefix, for example, 2- not -2

(Stock Indicator)

System maintained field; displays the following exception flags:

* - Indicates there is not enough stock to meet the requirement. Issuing is allowed for non lot controlled items, for which negative stock balances are allowed. Issuing is not allowed for lot controlled items that cannot hold negative balances.

< - Indicates it is a backflushed material and cannot be issued manually.

UOM

This is the issuing unit of measure of the material.

St(ockroom)

This is the issuing stockroom.

Type

Each material issue may be designated a specific transaction type in preference to the default.

A transaction type is used for inventory analysis; it does not effect changes to item balances.

Transaction types are defined on the Style Inventory Management, descriptions file, against type TRAN.

Reference

Each material issue may be given a specific reference that overrides the default.

Batch

Enter the lot, batch or serial number of the material to be issued. This is a mandatory requirement for all lot controlled items.

Reference

Default issue reference. This defaults to the production order number but may be overridden.

Each item may be given a specific reference if required.

Transaction Type

Default transaction type. A transaction type is used for inventory analysis; it does not effect changes to item balances.

Transaction types are defined on the Style Inventory Management, descriptions file, against type TRAN

Date

Each issue is defined against an issue date. Defaults to the current date, or that entered on the selection parameters screen.

Mach

Machine. Only prompted if an operation is specified on the selection parameters screen, the option is given to select a machine to issue to. The default is that originally entered.

Select **F22=Expand/Contract** on Record Issues And Adjustments screen 1 to display Record Issues And Adjustments screen 2.

Functions:

F8

Confirm issue of all outstanding requirements. Any items that cannot be issued due to unavailability or no lot selected are highlighted in reverse video, and may subsequently be re-selected if the constraint is met.

F9

Attempts to issue those items that have been specifically requested by entering a 1 against them in the S(elect) column.

F14

Deallocate/Reallocate. This selection has different functions, depending upon the setting of the Complete Materials field on the Issue Materials screen:

- If you set the Complete Materials field to 0 or left the field blank, F14 does not display.
- If you set the Complete Materials field to 1, F14 displays as Deallocate, enabling you to deallocate materials that have already been issued.
- If you set the Complete Materials field to 2, F14 displays as Reallocate, enabling you to reallocate materials for a previous issue.

Note: If de-allocating materials and the production order includes floorstock or subcontract materials which have been transferred to a different stockroom but not yet consumed then material in BOTH stockrooms is de-allocated. Likewise, unconsumed backflush materials are also deallocated.

Note: The deallocation process automatically deletes any existing lot allocations. The reallocation process does not rebuild them. This is a manual task.

F19

Enables you to issue unplanned materials that do not appear on the route. A window is opened to enable a detailed request to be made.

F22

Displays extended information regarding each issue: order qty, quantity issued to-date, quantity outstanding, key material flag, (item) description, operation sequence and material input sequence.

Substitute Materials Window (Option 2)

Enter 2 in the Select field on Record Issues And Adjustments Screen 1 to display the Substitute Materials window.

Use this window to review alternative materials that can be used as a substitute for a material that is planned to be issued against a production order.

Tip: Substitute materials be linked to the standard material via the Style Inventory Management, *Alternative Parts* facility.

Fields:

Operation Sequence

Enter the operation at which the issue is required. If no operation is entered, the first operation on the route is defaulted to and displayed when Enter is pressed.

Unplanned Input

Enter the material to be issued, exploded to full product detail level.

-  Tip: Remember to include appropriate spaces in the item code, if an item code element does not utilise the maximum number of characters

Quantity

Enter the quantity to be issued.

UOM

Enter a valid issuing unit of measure. If no entry is made in this or the Stockroom field, the system defaults to and displays the UoM in the primary stockroom when Enter is pressed.

Batch

If the material is lot controlled, a reference number must be entered.

Reference

Each material may be given a specific reference. The default is the default reference from the main screen.

Transaction Type

Each material issue may be designated a specific transaction type in preference to the default.

A transaction type is used for inventory analysis; it does not effect changes to item balances.

Transaction types are defined on the Style Inventory Management, descriptions file, against type TRAN

Date

Defaults to the current date.

Reason Code

This is an analysis code that can be used in variance reports. Entry of a code is mandatory.

Codes are defined on the Style Inventory Management, descriptions file, against type MOVR

Production Order Selection Window (F16)

Select **F16=Review Orders** on the Issue Materials screen to display the Production Order Selection window.

From this screen, you can review the orders that satisfy the selection criteria entered on the Issue Materials, Selection Parameters screen.

```

```

Fields:

S(select)

- 1 - Display the Material Issues Summary Listing screen.
- 2 - Display any associated header text; orders with text are indicated in the T(ext) column by inclusion of an asterisk (*).

Production Order Booking

With this option, an operator can book times and quantities against one or more operations on several production orders. This saves having to re-enter information about yourself for every activity.

You may also mark operations as complete.

The booking procedure also enables you to 'unbook' previously booked work if mistakes or errors have been made in an earlier booking session.

Prerequisites

Before using this option:

- You must set up all base input data referring to machines, departments, operations, teams etc.

If you require scrap and held references, then you must define valid reason codes via the Style Inventory Management descriptions file, against type MOVR (option 1/STINM).

Completing An Operation Over Or Short

This function allows you to complete an operation where the total quantity booked over all transactions is either over or short. It is assumed that any held quantity will be released and is therefore included in the new planned production order quantity. For example:

Planned quantity:	100
Operation Complete:	60
Operation Held:	+20
New PO planned quantity:	80

Rework activities are ignored.

When an operation is completed over or short and the quantity adjustment conditions are met, Style automatically updates planned production order quantities and recalculates durations and work station loadings. The adjustments take account of:

- Wastage on both material and operations.
- Sales order reservations on production orders.
- Raw material allocations on inventory and lot inventory.

Activity Types

The activity type you select determines the range of fields prompted and whether these fields are optional or compulsory. For this reason, it is not possible to state against every field whether or not it is a mandatory requirement to complete it. You can define activity types via the Maintain Activity Control File facility.

In addition to the activity type definition, the format of, interpretation of, and use of details is further qualified by flag settings on the Company Profile, Organisational Model and route against which the order is being progressed.

Note: When more is received against a production order than the original order quantity, the available stock for these items changes. To compensate, if MRP is on-line and the Unplanned Issues and Receipts reason code is active, a trigger is created for the next MRP run.

For more information about the Unplanned Issues and Receipts reason code, refer to Net Change Reason Codes in Style Production Planning.

Production Order Booking Screen 1

Select Production Order Booking on the menu to display Production Order Booking screen 1.

MG200	ZS - Style Demonstration Co.	User GBJBAMS	25/03/96 12:04:56

05-18	SP	MW	KS IM II KENB20A PET166S2

Fields:

Date

Enter the date on which the activity took place. The field defaults to the current system date, but may be overtyped. All bookings made during a session are recorded against the date entered.

Shift

Enter the shift number to which the booking relates. This provides a more precise time frame for recording booking if a start and finish time are not entered (that is, elapsed time only is recorded).

For example, if the booking has an elapsed time of 3 hours, this could be linked to shift 2 that runs 16:00 to 24:00. If entered, this should be a shift number on the shift profile in force on the booking date at the machine at which the booking is made.

Shift numbers may be used as a selection parameter on performance reports.

Machine

A machine and/or department must be recorded against each booking.

If a machine is not entered, but a department is, booking details assume the standard machine defined for the operation on the production route. The machine would usually be the machine assigned to the operation on the production route.

If a non-standard (that is, not the machine on the route) is entered, any WIP inventory resulting from the booking is allocated to the WIP location associated with the nominated machine; which may differ to that on the production route.

If the WIP location differs, the system displays a window stating 'Reported WIP location is not the standard for this operation' and continuation must be manually confirmed.

If the operation booking involves utilisation of floor stock items, then any non-standard machine must be associated with the same floor stock location in order to issue materials. If it is not, a materials transfer must be actioned to the new location.

Dept

Departments are an analysis tool and do not effect any constraints over WIP inventory booking. For each booking, a machine or department must be entered.

If a machine is entered, but not a department, the system defaults to and displays the department assigned to the machine definition; if one exists; when Enter is pressed to validate header details.

If a machine is not entered, but a department is, booking details assume the standard machine defined for the operation on the production route.

If a department is not entered, but the operator has been assigned a department via Operator Maintenance, the system defaults to and displays that department when Enter is pressed to validate the header details.

Departments are user-defined and entered via the Departments Maintenance function. They are also held on the parameters file, against type DEPT

Operator

Enter an operator code identifying the person who performed the work. If left blank, a team code must be entered.

Tm

Enter a team code identifying the people who performed the work. Operator and team codes are mutually exclusive.

Any booked time associated with the operation is allocated to each member of the team automatically. For example, if an operator time of 8 hours is entered, each member of the team is assumed to have worked 8 hours at the operation. To amend these times, use **F13** that allows you to modify time on an individual basis.

Press **Enter** on Production Order Booking screen 1 to display Production Order Booking screen 2.

Production Order Booking Screen 2

Press **Enter** on Production Order Booking
Screen 1 to display Production Order Booking
Screen 2.

From this screen, enter production bookings against an order.

Fields:

Activity

The activity type defines what kind of information can be entered; which fields are mandatory, optional or excluded.

In addition it defines how the booking affects updates to the main database.

Activity types are defined via the Maintain Activity Control File facility, which also determines the default type displayed automatically, and the sequence in which alternative types are displayed when prompted.

Rev Ind

Reversal indicator. This flag indicates whether or not the booking is being entered to correct a previous booking where an error was made.

0 - Standard booking (default).

1 - Reversal. All quantities booked are 'unbooked' and all times entered result in a reduction of time spent at this operation. When transferred to the Booking Details Summary window, the associated order number is displayed in reverse video.

Production Order

Enter the order number against which the booking is to be made. The order must be at a status of 'Released' or 'Active'.

Operation

Enter the operation to which the time and/or quantity relates.

The machine/operation relationship determines the WIP location used to ascertain and maintain WIP inventory balances. This is usually that defined on the route, but as work may be reported at non-standard machines, WIP inventory may be recorded as being held at different WIP locations for the same order.

For successful backflushing of WIP inventory it is essential that all inventory pertaining to an order is recorded as existing in the standard WIP location. This is achieved by always booking at the standard machine; booking against a different machine with the same WIP location; or transferring WIP inventory from the non-standard to standard WIP locations.

To book WIP inventory, the Reporting Type flag on the route operation must be set to 0 or 1 (count points). By making a booking, you:

- Update WIP inventory balances at the booking operation.
- Backflush all operations back to but excluding the previous count point operation.

If the Reporting Type flag is set to 2 or 3 (backflushed) then operator, team and machine time, and operation rework activity may be booked; together with scrap and held details.

If the operation is subcontracted, then no booking may be made against it; in this circumstance, the facility is effectively replaced by the Progress at Subcontractor or Receive from Subcontractor routine.

If the operation is the last operation on the route, it must be a count point.

Lot Number

Enter a lot number relating to the WIP being booked. This is only ever a memorandum field for non lot controlled items. The number need not be that entered as a final lot when received into inventory.

If the WIP Lot Tracking flag on the Organisational Model is set to 1 (yes) then a lot number is a mandatory requirement if the item is lot controlled, and the quantity booked at an operation must be less than or equal to the quantity booked against the same lot number at the previous count point.

If WIP lot tracking is not used, then a number need not be entered, even for lot controlled items at this point. However, one must be entered when the item is received into inventory.

If the Key Operation flag on the operation is set to 4 (prompt for entry of lot number) the system enables you to change the lot reference at this point. This may be used, for example, if you want to track inventory produced using a particular dyelot.

If a key material is input to an operation, then the lot number should be left blank, as selection of the key material lot from the floor stock inserts the required lot number. This function occurs irrespective of the WIP Lot Tracking field setting.

If the key material is input to an operation other than the first, and WIP lot tracking is required, lot numbers must be used up to and including the key

material input operation. However, subsequent operations are forced to use the key material lot number.

Operator (Team) Time

Enter the time spent by an operator or a team.

Note: It is only possible to specify a maximum of 24 hrs per booking; and the time entered is synonymous with labour time when producing costings.

The format used to enter times is dependent on two flag settings on the Organisational Model.

If the Time Reporting Policy flag is set to 0 (elapsed time), then a single entry specifying 'time spent' need be entered. This field is further qualified by the Time Booking Policy flag that determines whether time should be booked in decimal hours (for example, 1.50 equates to 1 hour 30 minutes) or hours and minutes (for example, 1.30 equates to 1 hour 30 minutes).

It is essential that you understand which policy is in operation before booking time.

If the Time Reporting Policy flag is set to 1 (time in, time out) a start and finish time must be entered in 24hr clock format. The system calculates the resultant time spent.

Time spent is allocated to the operator if specified; or alternatively to each member of the team.

Machine Time

Enter the machine usage time. This may be more or less than the operator (team) time.

Note: It is only possible to enter a maximum of 24hrs per booking

The format used to enter times is dependent on two flag settings on the Organisational Model.

If the Time Reporting Policy flag is set to 0 (elapsed time), then a single entry specifying 'time spent' need be entered. This field is further qualified by the Time Booking Policy flag that determines whether time should be booked in decimal hours (for example, 1.50 equates to 1 hour 30 minutes) or hours and minutes (for example, 1.30 equates to 1 hour 30 minutes) It is essential that you understand which policy is in operation before booking time.

If the Time Reporting Policy flag is set to 1 (time in, time out) a start and finish time must be entered in 24hr clock format. The system calculates the resultant time spent.

Total

Enter a total quantity for the operation, including the scrap and held quantities that you enter in the Scrap and Held fields.

Style calculates the good quantity as Total less (Scrap + Held).

If you are using WIP lot tracking, enter a quantity that is less than or equal to the quantity reported at the prior count point operation for the lot number you enter in the Lot Number field.

If the total quantity this session, and the quantities booked to-date equal the planned quantity, the system automatically prompts with 'Operation complete, press Enter to continue'

After validating the Booking Details screen, the system opens a Variant Spread window if the reporting level for the operation is style / colour, style / size or style / colour / size. The quantity entered must then be allocated to each style / colour or style / colour / size variant.

Scrap

Enter the quantity scrapped at this operation. The system assumes that the full quantity of materials, labour and machine time required to make an equivalent 'good' quantity is also consumed in the production of scrap.

An additional **F17** function may be used to enter a reference and scrap reason code against the full quantity; or a range of codes against a number of quantities exploded to full product (variant) detail level.

Entry of a reference is never mandatory.

(Scrap) Reason

Enter a default reason code. The initial code displayed is that held on the Organisational Model.

Codes are defined on the Style Inventory Management, descriptions file, against type MOVR.

Held

Enter the quantity held at this operation. Quantities may be held, for example, for rework or quality inspection.

If a rework operation is being booked, a held quantity equal to that reworked may be recorded in WIP inventory at the WIP location where the rework is being actioned. This does not apply to rework associated with extra time at an operation. Held quantities are subsequently reduced when the rework is booked good.

To subsequently make held inventory available, you must use the Release Inventory option. Alternatively, held inventory may be scrapped using the Scrap Held Inventory option.

An additional **F18** function may be used to enter a reference and scrap reason code against the full quantity; or a range of codes against a number of quantities exploded to full product (variant) detail level.

If the Held Inventory Tracking flag on the Organisational Model is set to 1 (yes) then entry of a held reference is mandatory. The system prompts for entry when Enter is pressed to validate booking details.

(Held) Reason

Enter a default reason code. The initial code displayed is that held on the Organisational Model.

Codes are defined on the Style Inventory Management, descriptions file, against type MOVR.

Op(Eration) Complete

This field is automatically displayed following entry of a quantity 'good' that causes WIP inventory to equal planned operation quantity. This flag indicates whether or not any further bookings are expected at the operation.

0 - Operation not complete. Further booking is expected.

1 - Operation complete. No further booking is expected. The total booked may be less than or greater than planned. An operation may be set to 'Complete' via the Order Completion routine (option 8/P4M). Alternatively, a 'Complete' operation may also be re-opened in Order Completion.

Note: For a completed operation, if the following two conditions are met, then the quantity completed is marked as Over or Short as appropriate:

1. The operation is marked as one that requires production order adjustments. This is achieved by setting the Operation Type for this operation to 8 on the Additional Operation Values window in the Style Definition Management application (option 11/P1M).

2. The quantity completed falls outside the complete tolerances given in the CTOL parameter. The calculation assumes that any quantity held will be released and therefore included in the new production order quantity. To find out more about the CTOL parameter, refer to the Style Definition Management application (option 2/P1U).

Marking the quantity as over or short has the effect of recalculating durations, allocations, reservations, material requirements and machine loading.

This may be done on both planned and unplanned complete short / over operations.

Order Complete

This field automatically displays if the last operation books a 'good' quantity that causes WIP inventory to equal planned output quantity. This flag indicates whether or not any further bookings against the order are expected.

0 - Order not complete. Further booking is expected.

1 - Order complete. No further booking is expected. The total booked may be less than or greater than planned. If the product is FIFO costed, then Style produces a Cost Variance Report, detailing any material usage variances. This report shows:

- Planned order and receipt quantities for the style and its outputs.

- Planned, issued and recovered quantities for each material.
- Material costs for the quantities above with issued versus recovered cost variance.

Note: You can close or reopen an order via Order Completion.

Press **Enter** on Production Order Booking screen 2 to display the Product Distribution Total window.

Functions:

F13

Team details. Opens the Team Details window, from which you can change team member details and labour time allocation between individuals.

F14

Material Details. Opens the Material Details window, from which you can specify backflushed materials explicitly. Otherwise, Style determines backflushes as standard usage from the route/BOM.

F16

Receipt details. Opens the Inventory Receipts window, from which you can specify finished product variants. Otherwise, Style takes product variants from the route/BOM.

Note: This function only applies to the last operation of an order that has multiple variants.

F17

Scrap. Opens the Scrap WIP Details window, from which you can specify detailed scrap references and reason codes for scrapped items.

This function only appears after the Booking Details Summary window opens.

F18

Held. Opens the Held WIP Details window, from which you can specify detailed held references and reason codes for held items.

This function only appears after the Booking Details Summary window opens.

F19

Booking Details. Transfer the cursor to the Booking Details Summary window.

Product Distribution Total Window

From this window, enter a quantity for each variant produced.

Press **Enter** on Production Order Booking screen 2 to display the Product Distribution Total window.

Variant Quantity. Distribute the quantity entered against the variants displayed.

Press **Enter** on the Product Distribution Total window to display the Booking Details window.

Functions:

F10

There are two display modes for the matrix: 10 sizes with inputs up to 99999; 15 sizes with inputs up to 999 This function key changes the display from the default to the alternative display

Booking Details Window (F8)

Use this window to:

- Review bookings made during the current session.
- Modify incorrect booking details before updating the database.

The window displays summary information of all bookings made during the current session. The window opens after your first booking and remains open for the rest of the session.

Reversal bookings display in reverse video. (For more information, refer to the Rev Ind field on Production Order Booking screen 2.)

As you complete each production booking, Style adds the booking details to this window. At this point, Style does not update the production order. However, to allow you to make further bookings, Style removes the booking details you entered on Production Order Booking screen 2.

Press **Enter** on the Product Distribution Total window to display the Booking Details window.

Fields:

S(Elect)

Enter one of the following:

2 - Amend. Style writes *DELETE on the booking line and displays the original transaction in Production Order Booking screen 2. You can modify any details relating to the transaction.

4 - Delete. Style writes *DELETE on the booking line and discards the booking.

Functions:

F8

Update Style with all bookings made during the session.

Team Details Window (F13)

Use this window to indicate the following:

- Team members working for different lengths of time.
- Team members not working on this operation for this booking session.
- An operator who does not usually work in the team, but has been drafted in for a duration during this booking session.

The window lists the labour hours allocated to each member of the team; this is equal to the elapsed time or time in, time out entered.

The window caters for either time recording policy, but limits the fields available for amendment to operator and whichever field(s) the company default time reporting policy requires. For example, if recording elapsed time, the time in, time out fields are disabled and vice versa.

Select **F13=Team Details** on Production Order Booking screen 2 to display the Team Details window.

4=Delete
F12=Previous ENTER to Accept

Fields:

S(Elect)

4 - Delete. For this operation booking only, remove a member from the team.

Material Details Window (F14)

Use this window to:

- Override the operation sequence, quantity and issuing stockroom and standard material requirements.
- Record additional, unexpected material usage.
- Record set up and indirect overhead material usage.

This window displays:

- Materials that are to be backflushed at this operation as a consequence of booking.
- Materials that have been transferred to floor stock and require formal issue at this point.
- Standard quantities required, as determined by the production route.

Note: If you do not make amendments via this window, Style backflushes standard material requirements automatically.

The window highlights any key material requirement. If the key material has not been transferred to the floor stock, then booking is not permitted.

Any booking to a non-standard machine (that is, not the machine defined on the route), only prompts for materials available in floor stock for the floor stock location assigned to the non-standard machine. To book to a non-standard machine, either issue new material to the relevant floor stock location or transfer material from the standard floor stock location.

Note: Materials that have been formally issued to the order are not displayed.

Select **F14=Materials** on Production Order Booking screen 2 to display the Material Details window.

Material Details

S Material	Opsq	Quantity
Add/Amend		
Stockroom....?	Reason	
1=Select Lots 3=Amend		
F12=Previous ENTER to Accept		

Fields:

S

Select. You can enter the following options:

- 1 - Select Lots. If you are using WIP lot tracking, then the lot number you select is the lot number against which you must make all subsequent bookings until order completion. (Mandatory.)
- 3 - Amend. Amend the material, operation sequence and/or quantity.

Material

To amend the material, enter 3 in the Select field. Enter an item code in the Material field. The item does not have to be a backflushed material.

Opsq

To amend the operation sequence, enter 3 in the Select field. The sequence number must be either the current operation or an operation subsequent to the previous count point operation. Do not enter a future operation.

Quantity

To amend the quantity, enter 3 in the Select field. Enter the quantity issued.

Stockroom

Enter the issuing stockroom.

Reason

Enter a reason code identifying one of the following:

- Why the additional unplanned material has been issued.
- Why changes have been made to the standard backflush requirements.

Codes are defined on the Style Inventory Management, descriptions file, against type MOVR.

Inventory Receipts Window (F16)

To display this window, select **F16=Receipt Details** from Production Order Booking screen 2 when recording work against the final operation on an order.

Note: If the planned receiving stockroom is warehouse controlled, then this window displays automatically.

Use this window to override the variant spread produced at an operation, where the spread differs from that expected from the production order details.

If the planned receiving stockroom is warehouse controlled, use this window to override the receiving stockroom and other receipt information. For example, you can change the receiving stockroom so that the finished styles are no longer warehouse controlled.

Note: If you do not make amendments, then Style makes receipts to standard stockrooms and lot numbers automatically.

Fields:

S

Select. Enter one of the following:

- 1 - Select. Open the Add/Amend Receipt window, allowing you to override receipt details.
- 2 - Complete. Indicate that you do not wish to book further quantities against the selected variant or make any further changes.

Functions:

F8

Confirm. Confirm receipt details and update.

F14

Unplanned Receipt. Open the Add/Amend Receipt window, from which you can enter details of unplanned, unexpected receipt(s).

Add/Amend Receipt Window (F14)

To display this window, select **F14=Unplanned Receipt** from the Inventory Receipts window.

Use this window to:

- Enter unplanned variants produced at an operation. You must enter a reason code and a product code.
- Record the receipt of planned variants into stockrooms other than the default. Initially, this window displays the default, standard details.

You can access this window only when booking work against the final operation on a production order.

Tip: Use this window to receive variants into a stockroom that is not the default, as defined on the production route. For example, seconds (sub-standard) variants may have been produced and then stocked in different stockrooms (whether physical or logical).

Narrative...	W000771/0070
Tran Type.?	

1=Select
F8=Conf
F14=Unp
F4=Prompt F12=Previous

Fields:

Item

Enter the style code for the finished style that you are receiving into stock.

If amending a receipt, this is a display field only, showing the inventory item listed on the select line exploded to full product detail level.

Quantity

This field displays the quantity that you entered on Production Order Booking screen 2. If necessary, amend this value to reflect the quantity produced. You may increase or decrease this quantity to any positive value.

Note: If amending a receipt, enter the actual rather than planned receipt quantity.

Stockroom

This field displays the default receiving stockroom for the finished style. You can amend this stockroom to a warehouse or style inventory stockroom.

If you enter a warehouse controlled stockroom in this field, then the Warehouse Details window opens automatically. From this window, enter a pack type for each style variant.

Lot

If the item is lot controlled, you must enter a lot number. The default is the production lot.

If the quantity being booked is to be added to an existing inventory lot, you can overtype the default with the lot number.

You can enter a new lot number. In this case, on confirming the details via F8 on the Inventory Receipts window, a Lot Number Maintenance window opens to allow you to define parameters for the new lot.

Reason

This field is only prompted if an unplanned receipt is being entered, and entry is mandatory.

Codes are defined on the Style Inventory Management, descriptions file, against type MOVR.

Narrative

This field defaults to the production order and operation sequence number. This field allows for specific narrative to be associated with this item in inventory. The default narrative is one of the following:

- The WIP lot number for the style/operation booking.
- A concatenation of the production order number and operation sequence number for non lot controlled styles.

If you do not enter a receipt, Style uses the relevant default.

Tran Type

Transaction type. If you are using WIP lot tracking, then this field is mandatory as Style needs to be able to track according to location and usage. Transaction types are used for inventory analysis and do not effect any changes to the system database.

Codes are defined on the Style Inventory Management, descriptions file against type TRAN.

Warehouse Details window

This window displays automatically if you enter a warehouse controlled stockroom in the Stockroom field on the Add/Amend Receipt window.

Use this window to enter a pack type for each style variant.

Fields:

Pack Type

Enter a pack type such as a box or pallet.

Scrap WIP Details Window (F17)

Use this window to enter details of the reasons for scrapping the items quoted on the Booking Details screen.

Press **Enter** on the Product Distribution Total window to display the Scrap WIP Details window.

Note: This window only displays if you have entered a quantity in the Scrap field on Production Order Booking screen 2.

Fields:

S

Select. If booking at style/colour, style/size or style/colour/size level, you can specify which particular variants have been scrapped. Enter:

1 - Full Product. Opens the Product Distribution Scrap window, from which you can distribute scrap quantity against variants.

Reference

Enter a reference (up to 15 alphanumeric characters) in upper case.

If you enter any references, then you must enter references for all of the booked scrap quantity.

Quantity

Distribute the scrap quantity between each reference.

Reason

Enter a scrap reason code (mandatory).

Codes are defined against type MOVR on the Style Inventory Management descriptions file.

Held WIP Details Window (F18)

Use this window to enter details of the reasons for holding the items quoted on the Booking Details screen.

Press **Enter** on the Product Distribution Total window to display the Held WIP Details window.

Note: This window only displays if you have entered a quantity in the Held field on Production Order Booking screen 2.

Note: This window opens automatically if the Held Inventory Tracking flag on the Organisational Model is set to 1 (yes).

Fields:

S

Select. If booking at style/colour, style/size or style/colour/size level, you can specify which particular variants have been held. Enter:

1 - Full Product. Opens the Product Distribution Held window, from which you can distribute held quantity against variants.

Reference

Enter a reference (up to 15 alphanumeric characters) in upper case.

If you enter any references, then you must enter references for all of the booked scrap quantity.

Quantity

Distribute the held quantity between each reference.

Reason

Enter a scrap reason code (mandatory).

Codes are defined against type MOVR on the Style Inventory Management descriptions file.

Operator Booking

1...
2... **3/P4T**

With this option, an operator can record times and quantities against one or more operations on a single production order. This saves you having to re-input the order heading details for every operation.

The booking procedure also enables you to 'unbook' previously booked work if mistakes or errors have been made in an earlier booking session.

The completion and validation of fields is the same as that for Production Order Booking; the routine varies only in the header details prompted.

Before using this option:

- You must set up all base input data referring to machines, departments, operations, teams etc.
- If you require scrap and held references, then you must define valid reason codes via the Style Inventory Management descriptions file, against type MOVR (option 1/STINM).

Activity Types

The activity type you select determines the range of fields prompted and whether these fields are optional or compulsory. For this reason, it is not possible to state against every field whether or not it is a mandatory requirement to complete it. Activity types are defined via the Maintain Activity Control File facility.

In addition to the activity type definition, the format of, interpretation of, and use of details is further qualified by flag settings on the Company Profile, Organisational Model and route against which the order is being progressed.

Operator Booking Screen 1

Select Operator Booking on the menu to display
Operator Booking screen 1.

MG200	ZS - Style Demonstration Co.	User GBJBAMS	25/03/96 12:08:40
Operator Booking			
Header details			
Date.....?	25/03/96	Shift	__
Machine Type.?	_____	Dept.?	_____
Order.....?	_____		
Operation....?	_____		
Lot Number...?	_____		
F3=Exit F4=Prompt			
05-18	SP	MW	KS IM II KENB20A PET166S2

Fields:

Date

Enter the date on which the activity took place. The field defaults to the current system date, but may be overtyped. All bookings made during a session are recorded against the date entered.

Shift

Enter the shift number to which the booking relates. This provides a more precise time frame for recording booking if a start and finish time are not entered (that is, elapsed time only is recorded). For example, if the booking has an elapsed time of 3 hours, this could be linked to shift 2 which runs 16:00 to 24:00. If entered, this should be a shift number on the shift profile in force on the booking date at the machine at which the booking is made.

Shift numbers may be used as a selection parameter on performance reports.

Machine

A machine and/or department must be recorded against each booking.

If a machine is not entered, but a department is, booking details assume the standard machine defined for the operation on the production route. The machine would usually be the machine assigned to the operation on the production route.

If a non-standard (that is, not the machine on the route) is entered, any WIP inventory resulting from the booking is allocated to the WIP location associated with the nominated machine; which may differ to that on the production route.

If the WIP location differs, the system displays a window stating 'Reported WIP location is not the standard for this operation' and continuation must be manually confirmed.

If the operation booking involves utilisation of floor stock items, then any non-standard machine must be associated with the same floor stock location in order to issue materials. If it is not, a materials transfer must be actioned to the new location.

Dept

Departments are an analysis tool and do not effect any constraints over WIP inventory booking. For each booking, a machine or department must be entered.

If a machine is entered, but not a department, the system defaults to and displays the department assigned to the machine definition; if one exists; when Enter is pressed to validate header details.

If a machine is not entered, but a department is, booking details assume the standard machine defined for the operation on the production route.

If a department is not entered, but the operator has been assigned a department via Operator Maintenance, the system defaults to and displays that department when Enter is pressed to validate the header details.

Departments are user-defined and entered via the Departments Maintenance function. They are also held on the parameters file, against type DEPT

Order

Enter the order number against which the booking is to be made. The order must be at a status of 'Released' or 'Active'.

Operation

Enter the operation to which the time and/or quantity relates.

The machine/operation relationship determines the WIP location used to ascertain and maintain WIP inventory balances. This is usually that defined on the route, but as work may be reported at non-standard machines, WIP inventory may be recorded as being held at different WIP locations for the same order.

For successful backflushing of WIP inventory it is essential that all inventory pertaining to an order is recorded as existing in the standard WIP location. This is achieved by always booking at the standard machine; booking against a different machine with the same WIP location; or transferring WIP inventory from the non-standard to standard WIP locations.

To book WIP inventory, the Reporting Type flag on the route operation must be set to 0 or 1 (count points). By making a booking, you:

- Update WIP inventory balances at the booking operation.
- Backflush all operations back to but excluding the previous count point operation.

If the Reporting Type flag is set to 2 or 3 (backflushed) then operator, team and machine time, and operation rework activity may be booked; together with scrap and held details.

If the operation is subcontracted, then no booking may be made against it; in this circumstance, the facility is effectively replaced by the Progress at Subcontractor or Receive from Subcontractor routine.

If the operation is the last operation on the route, it must be a count point.

Lot Number

Enter a lot number relating to the WIP being booked. This is a memorandum field only for non lot controlled items. The number need not be that entered as a final lot when received into inventory.

If the WIP Lot Tracking flag on the Organisational Model is set to 1 (yes) then a lot number is a mandatory requirement if the item is lot controlled, and the quantity booked at an operation must be less than or equal to the quantity booked against the same lot number at the previous count point.

If WIP lot tracking is not used, then a number need not be entered, even for lot controlled items at this point. However, one must be entered when the item is received into inventory.

If the Key Operation flag on the operation is set to 4 (prompt for entry of lot number) the system enabled you to change the lot reference at this point.

This may be used, for example, if you want to track inventory produced using a particular dyelot.

If a key material is input to an operation, then the lot number should be left blank, as selection of the key material lot from the floor stock inserts the required lot number. This function occurs irrespective of the WIP Lot Tracking field setting.

If the key material is input to an operation other than the first, and WIP lot tracking is required, lot numbers must be used up to and including the key material input operation. However, subsequent operations are forced to use the key material lot number.

Operator Booking Screen 2

From this screen, you can book production details for an operator.

Press **Enter** on Operator Booking screen 1 to display Operator Booking screen 2.

12-18	SA	MW KS CL IM DM II	STUD140 KB PED201S1

Fields:

Activity

The activity type defines what type of information can be entered; which fields are mandatory, optional or excluded.

In addition, it defines how the booking effects updates to the main database.

Activity types are defined via the Maintain Activity Control File facility, which also determines the default type displayed automatically, and the sequence in which alternative types are displayed when prompted.

Rev Ind

Reversal indicator. This flag indicates whether or not the booking is being entered to correct a previous booking where an error was made.

0 - Standard booking (default).

1 - Reversal. All quantities booked are 'unbooked' and all times entered result in a reduction of time spent at this operation. When transferred to the Booking Details Summary window, the associated order number is displayed in reverse video.

Operator

Enter an operator code identifying the person who performed the work. If left blank, a team code must be entered.

Tm

Enter a team code identifying the people who performed the work. Operator and team codes are mutually exclusive.

Any booked time associated with the operation is allocated to each member of the team automatically. For example, if an operator time of 8 hours is entered, each member of the team is assumed to have worked 8 hours at the operation. To amend these times, use **F13** which allows you to modify time on an individual basis.

Operator (Team) Time

Enter the time spent by an operator or a team.

Note: It is only possible to specify a maximum of 24 hrs per booking; and the time entered is synonymous with labour time when producing costings

The format used to enter times is dependent on two flag settings on the Organisational Model.

If the Time Reporting Policy flag is set to 0 (elapsed time), then a single entry specifying 'time spent' need be entered. This field is further qualified by the Time Booking Policy flag which determines whether time should be booked in decimal hours (for example, 1.50 equates to 1 hour 30 minutes) or hours and minutes (for example, 1.30 equates to 1 hour 30 minutes) It is essential that you understand which policy is in operation before booking time.

If the Time Reporting Policy flag is set to 1 (time in, time out) a start and finish time must be entered in 24hr clock format. The system calculates the resultant time spent.

Time spent is allocated to the operator if specified; or alternatively to each member of the team.

Machine Time

Enter the machine usage time.

This may be more or less than the operator (team) time.

Note: It is only possible to enter a maximum of 24hrs per booking

The format used to enter times is dependent on two flag settings on the Organisational Model.

If the Time Reporting Policy flag is set to 0 (elapsed time), then a single entry specifying 'time spent' need be entered. This field is further qualified by the Time Booking Policy flag which determines whether time should be booked in decimal hours (for example, 1.50 equates to 1 hour 30 minutes) or hours and minutes (for example, 1.30 equates to 1 hour 30 minutes) It is essential that you understand which policy is in operation before booking time.

If the Time Reporting Policy flag is set to 1 (time in, time out) a start and finish time must be entered in 24hr clock format. The system calculates the resultant time spent.

Total

Enter a total quantity for the operation, including the scrap and held quantities that you enter in the Scrap and Held fields.

Style calculates the good quantity as Total less (Scrap + Held).

If you are using WIP lot tracking, enter a quantity that is less than or equal to the quantity reported at the prior count point operation for the lot number you enter in the Lot Number field.

If the reported quantity this session, and the quantities booked to-date equal the planned quantity, the system automatically prompts with 'Operation complete, press Enter to continue'

After validating the Booking Details screen, the system opens a Variant Spread window if the reporting level for the operation is style / colour, style / size or style / colour / size, the quantity entered must then be allocated to each style / colour or style / colour / size variant.

Quantity Scrap

Enter the quantity scrapped at this operation. The system assumes that the full quantity of materials, labour and machine time required to make an equivalent 'good' quantity is also consumed in the production of scrap.

An additional **F17** function may be used to enter a reference and scrap reason code against the full quantity; or a range of codes against a number of quantities exploded to full product (variant) detail level.

Entry of a reference is never mandatory.

Scrap Reason

Enter a default reason code. The default code is that held on the Organisational Model. Codes are defined on the Style Inventory Management, descriptions file, against type MOVR.

Quantity Held

Enter the quantity held at this operation. Quantities may be held, for example, for rework or quality inspection.

If a rework operation is being booked, a held quantity equal to that reworked may be recorded in WIP inventory at the WIP location where the rework is being actioned. This does not apply to rework associated with extra time at an operation. Held quantities are subsequently reduced when the rework is booked good.

To subsequently make held inventory available, you must use the Release Inventory option). Alternatively, scrap held inventory through the Scrap Held Inventory option.

An additional **F18** function may be used to enter a reference and scrap reason code against the full quantity; or a range of codes against a number of quantities exploded to full product (variant) detail level.

If the Held Inventory Tracking flag on the Organisational Model is set to 1 (yes) then entry of a held reference is mandatory; and the system prompts for entry when **Enter** is pressed to validate booking details.

Held Reason

Enter a default reason code. The initial code displayed is that held on the Organisational Model.

Codes are defined on the Style Inventory Management, descriptions file, against type MOVR

Op(eration) Complete

This field is automatically prompted following entry of a quantity good that causes WIP inventory to equal planned operation quantity.

This flag indicates whether or not any further bookings are expected at the operation.

0 - Operation not complete. Further booking is expected.

1 - Operation complete. No further booking is expected. The total booked may be less than or greater than planned. An operation may be set to 'Complete' via the Order Completion option (8/P4M). Alternatively, a 'Complete' operation may be re-opened using the same option.

Note: For a completed operation, if the following two conditions are met, then the quantity completed is marked as Over or Short as appropriate:

1. The operation is marked as one that requires production order adjustments. This is achieved by setting the Operation Type for this operation to 8 on the Additional Operation Values window in the Style Definition Management application (option 11/P1M).

2. The quantity completed falls outside the complete tolerances given in the CTOL parameter. The calculation assumes that any quantity held will be released and therefore included in the new production order quantity. To find out more about the CTOL parameter, refer to Style Definition Management.

Marking the quantity as over or short has the effect of recalculating durations, allocations, reservations, material requirements and machine loading.

This may be done on both planned and unplanned complete short/over operations.

Order Complete

This field automatically displays if the last operation books a 'good' quantity that causes WIP inventory to equal planned output quantity. This flag indicates whether or not any further bookings against the order are expected.

0 - Order not complete. Further booking is expected.

1 - Order complete. No further booking is expected. The total booked may be less than or greater than planned. If the product is FIFO costed, then Style

produces a Cost Variance Report, detailing any material usage variances. This report shows:

- Planned order and receipt quantities for the style and its outputs.
- Planned, issued and recovered quantities for each material.
- Material costs for the quantities above with issued versus recovered cost variance.

Press **Enter** on Operator Booking screen 2 to display the Product Distribution Total window.

Functions:

F13

Team details. Opens the Team Details window, from which you can change team member details and labour time allocation between individuals.

F14

Material Details. Opens the Material Details window, from which you can specify backflushed materials explicitly. Otherwise, Style determines backflushes as standard usage from the route/BOM.

F16

Receipt details. Opens the Inventory Receipts window, from which you can specify finished product variants. Otherwise, Style takes product variants from the route/BOM.

F17

Scrap. Opens the Scrap WIP Details window, from which you can specify detailed scrap references and reason codes for scrapped items.

This function only appears after the Booking Details Summary window opens.

F18

Hold. Opens the Held WIP Details window, from which you can specify detailed held references and reason codes for held items.

This function only appears after the Booking Details Summary window opens.

F19

Booking Details. Transfer the cursor to the Booking Details Summary window.

Product Distribution Total Window

From this window, enter a quantity for each variant produced. For more details, refer to the Production Order Booking option.

Press **Enter** on Operator Booking screen 2 to display the Product Distribution Total window.

Booking Details Window (F8)

Use this window to:

- Review bookings made during the current session.
- Modify incorrect booking details before updating the database.

For more details, refer to the Production Order Booking option.

Press **Enter** on the Product Distribution Total window to display the Booking Details window.

Team Details Window (F13)

Use this window to indicate the following:

- Team members working for different lengths of time.
- Team members not working on this operation for this booking session.
- An operator who does not usually work in the team, but has been drafted in for a duration during this booking session.

For more details, refer to the Production Order Booking option.

Select **F13=Team Details** on Operator Booking screen 2 to display the Team Details window.

Material Details Window (F14)

Use this window to:

- Override the operation sequence, quantity and issuing stockroom and standard material requirements.
- Record additional, unexpected material usage.
- Record set up and indirect overhead material usage.

For more details, refer to the Production Order Booking option.

Select **F14=Materials** on Operator Booking screen 2 to display the Material Details window.

Inventory Receipts Window (F16)

Select **F16=Receipt Details** on Operator Booking screen 2 to display the Inventory Receipts window.

Note: If the planned receiving stockroom is warehouse controlled, then this window displays automatically.

This window is fully described under the Production Order Booking option.

Scrap WIP Details Window (F17)

Use this window to enter details of the reasons for scrapping the items quoted on the Booking Details screen.

For more details, refer to the Production Order Booking option.

Press **Enter** on the Product Distribution Total window to display the Scrap WIP Details window.

Note: This window only displays if you have entered a quantity in the Scrap field on Operator Booking screen 2.

Held WIP Details Window (F18)

Use this window to enter details of the reasons for scrapping the items quoted on the Booking Details screen.

For more details, refer to the Production Order Booking option.

Press **Enter** on the Product Distribution Total window to display the Held WIP Details window.

Note: This window only displays if you have entered a quantity in the Held field on Operator Booking screen 2.

Timesheet Bookings

To make a timesheet booking, use one of the following options:

- **Manual Timesheet Booking.** This option allows you to make bookings for an operator or a team from a timesheet, on which there is a single elapsed time for a series of activities.
- **Bundle Timesheet Booking.** Use this option if you wish to book bundles rather than book against one particular production order number.

Manual Timesheet Booking

4/P4T

Use this option to book time for an operator or team from a timesheet, on which there is a single elapsed time for a series of activities. For performance analysis, Style spreads this time pro-rata across all the activities carried out during the timeframe that the timesheet covers.

The completion and validation of fields is the same as that for Production Order Booking.

Completing An Operation Over Or Short

This function allows you to complete an operation where the total quantity booked over all transactions is either over or short. It is assumed that any held quantity will be released and is therefore included in the new planned production order quantity. For example:

Planned quantity: 100

Operation: Complete: 60

Operation: Held: +20

New PO planned quantity: 80

Rework activities are ignored.

When an operation is completed over or short and the quantity adjustment conditions are met, Style automatically updates planned production order quantities and recalculates durations and work station loadings. The adjustments take account of:

- Wastage on both material and operations.
- Sales order reservations on production orders.
- Raw material allocations on inventory and lot inventory.

Note: It is not possible to amend the header details once they have been confirmed

Timesheet Booking Screen 1

Select Manual Timesheet Booking on the menu to display Timesheet Booking screen 1.

Fields:

Date

Enter the date on which the activity took place. The field defaults to the current system date, but may be overtyped.

All bookings made during a session are recorded against the date entered.

Shift

Enter the shift number to which the booking relates. This provides a more precise time frame for recording booking if a start and finish time are not entered (that is, elapsed time only is recorded).

For example, if the booking has an elapsed time of 3 hours, this could be linked to shift 2 which runs 16:00 to 24:00. If entered, this should be a shift number on the shift profile in force on the booking date at the machine at which the booking is made.

Shift numbers may be used as a selection parameter on performance reports.

Machine

A machine and/or department must be recorded against each booking.

If a machine is not entered, but a department is, booking details assume the standard machine defined for the operation on the production route. The machine would usually be the machine assigned to the operation on the production route.

If a non-standard (that is, not the machine on the route) is entered, any WIP inventory resulting from the booking is allocated to the WIP location associated with the nominated machine; which may differ to that on the production route.

If the WIP location differs, the system displays a window stating 'Reported WIP location is not the standard for this operation' and continuation must be manually confirmed.

If the operation booking involves utilisation of floor stock items, then any non-standard machine must be associated with the same floor stock location in order to issue materials. If it is not, a materials transfer must be actioned to the new location.

Dept

Departments are an analysis tool and do not effect any constraints over WIP inventory booking. For each booking, a machine or department must be entered.

If a machine is entered, but not a department, the system defaults to and displays the department assigned to the machine definition; if one exists; when Enter is pressed to validate header details.

If a machine is not entered, but a department is, booking details assume the standard machine defined for the operation on the production route.

If a department is not entered, but the operator has been assigned a department via Operator Maintenance, the system defaults to and displays that department when Enter is pressed to validate the header details.

Departments are user-defined and entered via the Departments Maintenance function. They are also held on the parameters file, against type DEPT

Operator

Enter an operator code identifying the person who performed the work.

If left blank, a team code must be entered.

Tm

Enter a team code identifying the people who performed the work. Operator and team codes are mutually exclusive.

Any booked time associated with the operation is allocated to each member of the team automatically. For example, if an operator time of 8 hours is entered, each member of the team is assumed to have worked 8 hours at the operation. To amend these times, use F13 which allows you to modify time on an individual basis.

Oper Elapsed

Enter the elapsed time covered by the timesheet if it relates to an operator.

Mach Elapsed

Enter the elapsed time covered by the timesheet if it relates to a machine.

Functions:

F13

Review time allocation by team member.

Timesheet Booking Screen 2

Use this screen to enter timesheet booking details.

Press **Enter** on Timesheet Booking screen 1 to display Timesheet Booking screen 2.

This screen is displayed after validation of the Header Details screen.

Fields:

Activity

The activity type defines what type of information can be entered; which fields are mandatory, optional or excluded.

In addition it defines how the booking effects updates to the main database.

Activity types are defined via the Maintain Activity Control File facility, which also determines the default type displayed automatically, and the sequence in which alternative types are displayed when prompted.

Rev Ind

Reversal indicator. This flag indicates whether or not the booking is being entered to correct a previous booking where an error was made.

0 - Standard booking (default).

1 - Reversal. All quantities booked are 'unbooked' and all times entered result in a reduction of time spent at this operation. When transferred to the Booking Details Summary window, the associated order number is displayed in reverse video.

Production Order

Enter the order number against which the booking is to be made. The order must be at a status of 'Released' or 'Active'

Operation

Enter the operation to which the time and/or quantity relates.

The machine/operation relationship determines the WIP location used to ascertain and maintain WIP inventory balances. This is usually that defined on the route, but as work may be reported at non-standard machines, WIP inventory may be recorded as being held at different WIP locations for the same order.

For successful backflushing of WIP inventory it is essential that all inventory pertaining to an order is recorded as existing in the standard WIP location. This is achieved by always booking at the standard machine; booking against a different machine with the same WIP location; or transferring WIP inventory from the non-standard to standard WIP locations.

To book WIP inventory, the Reporting Type flag on the route operation must be set to 0 or 1 (count points). By making a booking, you:

- Update WIP inventory balances at the booking operation.
- Backflush all operations back to but excluding the previous count point operation.

If the Reporting Type flag is set to 2 or 3 (backflushed) then operator, team and machine time, and operation rework activity may be booked; together with scrap and held details.

If the operation is subcontracted, then no booking may be made against it; in this circumstance, the facility is effectively replaced by the Progress at Subcontractor or Receive from Subcontractor routine.

If the operation is the last operation on the route, it must be a count point.

Lot Number

Enter a lot number relating to the WIP being booked. This is only ever a memorandum field for non lot controlled items. The number need not be that entered as a final lot when received into inventory.

If the WIP Lot Tracking flag on the Organisational Model is set to 1 (yes) then a lot number is a mandatory requirement if the item is lot controlled, and the quantity booked at an operation must be less than or equal to the quantity booked against the same lot number at the previous count point.

If WIP lot tracking is not used, then a number need not be entered, even for lot controlled items at this point. However, one must be entered when the item is received into inventory.

If the Key Operation flag on the operation is set to 4 (prompt for entry of lot number) the system enables you to change the lot reference at this point. This may be used, for example, if you want to track inventory produced using a particular dyelot.

If a key material is input to an operation, then the lot number should be left blank, as selection of the key material lot from the floor stock inserts the required lot number. This function occurs irrespective of the WIP Lot Tracking field setting.

If the key material is input to an operation other than the first, and WIP lot tracking is required, lot numbers must be used up to and including the key material input operation. However, subsequent operations are forced to use the key material lot number.

Operator (Team) Time

Enter the Off Standard or Down Time spent by an operator or a team. Any Actual Time for On Standard production work is automatically calculated for the timesheet.

Note: It is only possible to specify a maximum of 24 hrs per booking; and the time entered is synonymous with labour time when producing costings

The format used to enter times is dependent on two flag settings on the Organisational Model.

If the Time Reporting Policy flag is set to 0 (elapsed time), then a single entry specifying 'time spent' need be entered.

This field is further qualified by the Time Booking Policy flag that determines whether time should be booked in decimal hours (for example, 1.50 equates to 1 hour 30 minutes) or hours and minutes (for example, 1.30 equates to 1 hour 30 minutes) It is essential that you understand which policy is in operation before booking time.

If the Time Reporting Policy flag is set to 1 (time in, time out) a start and finish time must be entered in 24hr clock format. The system calculates the resultant time spent.

Time spent is allocated to the operator if specified; or alternatively to each member of the team.

Machine Time

Enter the Off Standard or Down Time machine time. Any Actual Time for standard production work is automatically calculated for the timesheet. This may be more or less than the operator (team) time.

Note: It is only possible to enter a maximum of 24hrs per booking

The format used to enter times is dependent on two flag settings on the Organisational Model.

If the Time Reporting Policy flag is set to 0 (elapsed time), then a single entry specifying 'time spent' need be entered. This field is further qualified by the Time Booking Policy flag that determines whether time should be booked in decimal hours (for example, 1.50 equates to 1 hour 30 minutes) or hours and minutes (for example, 1.30 equates to 1 hour 30 minutes) It is essential that you understand which policy is in operation before booking time.

If the Time Reporting Policy flag is set to 1 (time in, time out) a start and finish time must be entered in 24hr clock format. The system calculates the resultant time spent.

Total

Enter a total quantity for the operation, including the scrap and held quantities that you enter in the Scrap and Held fields.

Style calculates the good quantity as Total less (Scrap + Held).

If you are using WIP lot tracking, enter a quantity that is less than or equal to the quantity reported at the prior count point operation for the lot number you enter in the Lot Number field.

If the reported quantity this session, and the quantities booked to-date equal the planned quantity, the system automatically prompts with the following message: 'Operation complete, press Enter to continue'

After validating the Booking Details screen, the system opens a Variant Spread window if the reporting level for the operation is style / colour, style / size or style / colour / size, the quantity entered must then be allocated to each style / colour or style / colour / size variant.

Quantity Scrap

Enter the quantity scrapped at this operation. The system assumes that the full quantity of materials, labour and machine time required to make an equivalent 'good' quantity is also consumed in the production of scrap. An additional **F17** function may be used to enter a reference and scrap reason code against the full quantity; or a range of codes against a number of quantities exploded to full product detail level. Entry of a reference is never mandatory.

Scrap Reason

Enter a default reason code. The initial code displayed is that held on the Organisational Model.

Codes are defined on the Style Inventory Management, descriptions file, against type MOVR

Quantity Held

Enter the quantity held at this operation. Quantities may be held, for example, for rework or quality inspection.

If a rework operation is being booked, a held quantity equal to that reworked may be recorded in WIP inventory at the WIP location where the rework is being actioned. This does not apply to rework associated with extra time at an operation. Held quantities are subsequently reduced when the rework is booked good.

To subsequently make held inventory available, you must use the Release Inventory option. Alternatively, held inventory may be scrapped using the Scrap Held Inventory option. An additional **F18** function may be used to enter a reference and scrap reason code against the full quantity; or a range of codes against a number of quantities exploded to full product (variant) detail level.

If the Held Inventory Tracking flag on the Organisational Model is set to 1 (yes) then entry of a held reference is mandatory; and the system prompts for entry when Enter is pressed to validate booking details.

Held Reason

Enter a default reason code. The initial code displayed is that held on the Organisational Model.

Codes are defined on the Style Inventory Management, descriptions file, against type MOVR.

Op(eration) Complete

This field is automatically prompted following entry of a quantity good that causes WIP inventory to equal planned operation quantity. This flag indicates whether or not any further bookings are expected at the operation.

0 - Operation not complete. Further booking is expected.

1 - Operation complete. No further booking is expected. The total booked may be less than or greater than planned. An operation may be set to 'Complete' via the Order Completion option.

Alternatively, a 'Complete' operation may be re-opened using the same facility.

Note: For a completed operation, if the following two conditions are met, then the quantity completed is marked as Over or Short as appropriate:

1. The operation is marked as one that requires production order adjustments. This is achieved by setting the Operation Type for this operation to 8 on the Additional Operation Values window in the Style Definition Management application (option 11/P1M).

2. The quantity completed falls outside the complete tolerances given in the CTOL parameter. The calculation assumes that any quantity held will be released and therefore included in the new production order quantity. To find out more about the CTOL parameter, refer to Style Definition Management.

Marking the quantity as over or short has the effect of recalculating durations, allocations, reservations, material requirements and machine loading.

This may be done on both planned and unplanned complete short/over operations.

Order Complete

Of the last operation is being booked, this field is automatically prompted following entry of a quantity good that causes WIP inventory to equal planned output quantity. This flag indicates whether or not any further bookings against the order are expected.

0 - Order not complete. Further booking is expected.

1 - Order complete. No further booking is expected. The total booked may be less than or greater than planned. An order may be set to 'Complete' via the Order Completion option (8/P4M). Alternatively, a 'Complete' order may be re-opened using the same option.

Press **Enter** on Timesheet Booking screen 2 to display the Product Distribution Total window.

Functions:

F13

Team details. Opens the Team Details window, from which you can change team member details and labour time allocation between individuals.

F14

Material Details. Opens the Material Details window, from which you can specify backflushed materials explicitly. Otherwise, Style determines backflushes as standard usage from the route/BOM.

F16

Receipt details. Opens the Inventory Receipts window, from which you can specify finished product variants. Otherwise, Style takes product variants from the route/BOM.

F17

Scrap. Opens the Scrap WIP Details window, from which you can specify detailed scrap references and reason codes for scrapped items.

This function only appears after the Booking Details Summary window opens.

F18

Hold. Opens the Held WIP Details window, from which you can specify detailed held references and reason codes for held items.

This function only appears after the Booking Details Summary window opens.

F19

Booking Details. Transfer the cursor to the Booking Details Summary window.

Product Distribution Total Window

From this window, enter a quantity for each variant produced. For more details, refer to the Production Order Booking option.

Press **Enter** on Timesheet Booking screen 2 to display the Product Distribution Total window.

Booking Details Window (F8)

Use this window to:

- Review bookings made during the current session.
- Modify incorrect booking details before updating the database.

For more details, refer to the Production Order Booking option.

Team Details Window (F13)

Use this window to indicate the following:

- Team members working for different lengths of time.
- Team members not working on this operation for this booking session.
- An operator who does not usually work in the team, but has been drafted in for a duration during this booking session.

For more details, refer to the Production Order Booking option.

Select **F13=Team Details** on Timesheet Booking screen 2 to display the Team Details window.

Material Details Window (F14)

Use this window to:

- Override the operation sequence, quantity and issuing stockroom and standard material requirements.
- Record additional, unexpected material usage.
- Record set up and indirect overhead material usage.

For more details, refer to the Production Order Booking option.

Select **F14=Materials** on Timesheet Booking screen 2 to display the Material Details window.

Inventory Receipts Window (F16)

Select **F16=Receipt Details** on Timesheet Booking screen 2 to display the Inventory Receipts window.

Note: If the planned receiving stockroom is warehouse controlled, then this window displays automatically.

This window is fully described under the Production Order Booking option.

Scrap WIP Details Window (F17)

Use this window to enter details of the reasons for scrapping the items quoted on the Booking Details screen.

For more details, refer to the Production Order Booking option.

Press **Enter** on the Product Distribution Total window to display the Scrap WIP Details window.

Note: This window only displays if you have entered a quantity in the Scrap field on Timesheet Booking screen 2.

Held WIP Details Window (F18)

Use this window to enter details of the reasons for scrapping the items quoted on the Booking Details screen.

For more details, refer to the Production Order Booking option.

Press **Enter** on the Product Distribution Total window to display the Held WIP Details window.

Note: This window only displays if you have entered a quantity in the Held field on Timesheet Booking screen 2.

Bundle Timesheet Booking

5/P4T

This option is intended for operators who process bundles rather than booking against a production order number.

By using a bar-code reader attached to the serial port on a PC, Style can read the bar-coded stubs from the bundle tickets

Style spreads the total actual time across each of the individual activities booked. When analysing operator performance, Style compares the time booked with the standard times you have set up for the operations.

Note: Because the routine is designed specifically for booking time for an operator or team during a stated timeframe, it is not possible to amend the header details once they have been confirmed

Bundle Booking Screen 1

Enter the period covered by the timesheet, together with the machine and/or department.

Select Bundle Timesheet Booking on the menu to display Bundle Booking screen 1.

```
MG250          ST - JBA System Test Company      User GBJBAMS    25/03/96
                                                    12:16:56

Mach Elapsed.  __.00

F3=Exit  F4=Prompt  F13=Team details

05-10  S2  MW  KS  IM  II  KENB20A  PET166S2
```

Fields:

Date

Enter the date on which the activity took place. The field defaults to the current system date, but may be overtyped. All bookings made during a session are recorded against the date entered.

Shift

Enter the shift number to which the booking relates. This provides a more precise time frame for recording booking if a start and finish time are not entered (that is, elapsed time only is recorded). For example, if the booking has an elapsed time of 3 hours, this could be linked to shift 2 that runs 16:00 to 24:00. If entered, this should be a shift number on the shift profile in force on the booking date at the machine at which the booking is made.

Shift numbers may be used as a selection parameter on performance reports.

Machine

A machine and/or department must be recorded against each booking.

If a machine is not entered, but a department is, booking details assume the standard machine defined for the operation on the production route. The machine would usually be the machine assigned to the operation on the production route.

If a non-standard (that is, not the machine on the route) is entered, any WIP inventory resulting from the booking is allocated to the WIP location associated with the nominated machine; which may differ to that on the production route.

If the WIP location differs, the system displays a window stating 'Reported WIP location is not the standard for this operation' and continuation must be manually confirmed.

If the operation booking involves utilisation of floor stock items, then any non-standard machine must be associated with the same floor stock location in order to issue materials. If it is not, a materials transfer must be actioned to the new location.

Dept

Departments are an analysis tool and do not effect any constraints over WIP inventory booking. For each booking, a machine or department must be entered.

If a machine is entered, but not a department, the system defaults to and displays the department assigned to the machine definition; if one exists; when Enter is pressed to validate header details.

If a machine is not entered, but a department is, booking details assume the standard machine defined for the operation on the production route.

If a department is not entered, but the operator has been assigned a department via Operator Maintenance, the system defaults to and displays that department when Enter is pressed to validate the header details.

Departments are user-defined and entered via the Departments Maintenance function. They are also held on the parameters file, against type DEPT

Operator

Enter an operator code identifying the person who performed the work. If left blank, a team code must be entered.

Tm

Enter a team code identifying the people who performed the work. Operator and team codes are mutually exclusive.

Any booked time associated with the operation is allocated to each member of the team automatically. For example, if an operator time of 8 hours is entered, each member of the team is assumed to have worked 8 hours at the operation. To amend these times, use **F13** that allows you to modify time on an individual basis.

Oper Elapsed

Enter the elapsed time covered by the timesheet if it relates to an operator.

Mach Elapsed

Enter the elapsed time covered by the timesheet if it relates to a machine.

Functions:

F13

Review time allocation by team member

Bundle Booking Screen 2

This screen is displayed after validation of the Header Details screen.

From this screen, enter production bookings against a bundle timesheet.

```

```

Fields:

Activity

The default bundle booking activity type is displayed. The activity type defines in detail what type of information can and cannot be entered; which fields are mandatory, optional or excluded.

In addition it defines how the booking effects updates to the main database.

Activity types are defined via the Maintain Activity Control File facility, which also determines the default type displayed automatically, and the sequence in which alternative types are displayed when prompted.

Rev Ind

Reversal indicator. This flag indicates whether or not the booking is being entered to correct a previous booking where an error was made.

0 - Standard booking (default).

1 - Reversal. All quantities booked are 'unbooked' and all times entered result in a reduction of time spent at this operation. When transferred to the Booking Details Summary window, the associated order number is displayed in reverse video.

Bundle

Enter the bundle ticket to book against.

Operation

Enter the operation to which the time and/or quantity relates. The Bundle/Operation fields can be entered via a bar-code reader by wandering in the bar-coded stub from the bundle ticket. The bar-coded stub is unique and cannot be recorded twice unless:

- The second entry is a reversal.
- The first entry included a quantity in the Split field. In this case, the defaulted quantity is the quantity split away from the bundle on the first booking.

The machine/operation relationship determines the WIP location used to ascertain and maintain WIP inventory balances. This is usually that defined on the route, but as work may be reported at non-standard machines, WIP inventory may be recorded as being held at different WIP locations for the same order.

For successful backflushing of WIP inventory it is essential that all inventory pertaining to an order is recorded as existing in the standard WIP location. This is achieved by always booking at the standard machine; booking against a different machine with the same WIP location; or transferring WIP inventory from the non-standard to the standard WIP locations.

To book WIP inventory, the Reporting Type flag on the route operation must be set to 0 or 1 (count points). By making a booking, you:

- Update WIP inventory balances at the booking operation.
- Backflush all operations back to but excluding the previous count point operation.

If the Reporting Type flag is set to 2 or 3 (backflushed) then operator, team and machine time, and operation rework activity may be booked; together with scrap and held details.

If the operation is subcontracted, then no booking may be made against it; in this circumstance, the facility is effectively replaced by the Progress at Subcontractor or Receive from Subcontractor routine.

If the operation is the last operation on the route, it must be a count point.

Lot Number

System maintained field; displays the lot number, where applicable, from the bundle record.

Operator (Team) Time

Enter the Off Standard or Down Time spent by an operator or a team. Any Actual Time for On Standard production work is automatically calculated for the timesheet.

Note: It is only possible to specify a maximum of 24 hrs per booking; and the time entered is synonymous with labour time when producing costings

The format used to enter times is dependent on two flag settings on the Organisational Model.

If the Time Reporting Policy flag is set to 0 (elapsed time), then a single entry specifying 'time spent' need be entered. This field is further qualified by the Time Booking Policy flag that determines whether time should be booked in decimal

hours (for example, 1.50 equates to 1 hour 30 minutes) or hours and minutes (for example, 1.30 equates to 1 hour 30 minutes) It is essential that you understand which policy is in operation before booking time.

If the Time Reporting Policy flag is set to 1 (time in, time out) a start and finish time must be entered in 24hr clock format. The system calculates the resultant time spent.

Time spent is allocated to the operator if specified; or alternatively to each member of the team.

Machine Time

Enter the Off Standard or Down Time machine time. Any Actual Time for standard production work is automatically calculated for the timesheet.

This may be more or less than the operator (team) time.

Note: It is only possible to enter a maximum of 24hrs per booking

The format used to enter times is dependent on two flag settings on the Organisational Model.

If the Time Reporting Policy flag is set to 0 (elapsed time), then a single entry specifying 'time spent' need be entered. This field is further qualified by the Time Booking Policy flag that determines whether time should be booked in decimal hours (for example, 1.50 equates to 1 hour 30 minutes) or hours and minutes (for example, 1.30 equates to 1 hour 30 minutes) It is essential that you understand which policy is in operation before booking time.

If the Time Reporting Policy flag is set to 1 (time in, time out) a start and finish time must be entered in 24hr clock format. The system calculates the resultant time spent.

Quantity

Total

Enter a total quantity for the bundle, including the scrap and split quantities that you enter in the Scrap and Split fields.

Style calculates the good quantity as Total less (Scrap + Split).

If you are making a second or subsequent booking for the same bundle, then the Total + Scrap + Split quantities that you enter must equal the quantity entered in the Split field in the previous booking.

If the reported quantity this session, and the quantities booked to-date equal the planned quantity, the system automatically prompts with 'Operation complete, press Enter to continue'

Quantity Scrap

Enter the quantity scrapped at this operation. The system assumes that the full quantity of materials, labour and machine time required to make an equivalent 'good' quantity is also consumed in the production of scrap. An additional **F17** function may be used to enter a reference and scrap reason code against the full quantity. Entry of a reference is never mandatory.

Scrap Reason

Enter a default reason code. The initial code displayed is that held on the Organisational Model.

Codes are defined on the Style Inventory Management, descriptions file, against type MOVR.

Held

An indicator that determines whether the bundle is held back, for example for rework or quality inspection. You can hold a whole bundle, but not part of a bundle.

Enter one of the following:

0 - No. The bundle is not held.

1 - Yes. Mark the bundle as held at this operation.

Subsequently, to make held inventory available, use the Release Inventory option (2/P4W). Alternatively, to scrap the held inventory, use Scrap Held Inventory (3/P4W).

An additional F18 function may be used to enter a reference and scrap reason code against the full quantity.

If the Held Inventory Tracking flag on the Organisational Model is set to 1 (yes) then entry of a held reference is mandatory; and the system prompts for entry when Enter is pressed to validate booking details.

Held Reason

Enter a default reason code. The initial code displayed is that held on the Organisational Model.

Codes are defined on the Style Inventory Management, descriptions file, against type MOVR.

Split

Enter the quantity of the bundle/operation that has not been worked on by the operator / team. This quantity is then available to be booked by another operator / team. It is possible to split a bundle / operation over many operator / teams.

Press **Enter** on Bundle Booking screen 2 to display the Product Distribution Total window.

Functions:

F13

Team details. Opens the Team Details window, from which you can change team member details and labour time allocation between individuals.

F14

Material Details. Opens the Material Details window, from which you can specify backflushed materials explicitly. Otherwise, Style determines backflushes as standard usage from the route/BOM.

F16

Receipt details. Opens the Inventory Receipts window, from which you can specify finished product variants. Otherwise, Style takes product variants from the route / BOM.

F17

Scrap. Opens the Scrap WIP Details window, from which you can specify detailed scrap references and reason codes for scrapped items.

This function only appears after the Booking Details Summary window opens.

F18

Hold. Opens the Held WIP Details window, from which you can specify detailed held references and reason codes for held items.

This function only appears after the Booking Details Summary window opens.

F19

Booking Details. Transfer the cursor to the Booking Details Summary window.

Product Distribution Total Window

From this window, enter a quantity for each variant produced. For more details, refer to the Production Order Booking option.

Press **Enter** on Bundle Booking screen 2 to display the Product Distribution Total window.

Booking Details Window (F8)

Use this window to:

- Review bookings made during the current session.
- Modify incorrect booking details before updating the database.

For more details, refer to the Production Order Booking option.

Press **Enter** on the Product Distribution Total window to display the Booking Details window.

Team Details Window (F13)

Use this window to indicate the following:

- Team members working for different lengths of time.
- Team members not working on this operation for this booking session.
- An operator who does not usually work in the team, but has been drafted in for a duration during this booking session.

For more details, refer to the Production Order Booking option.

Select **F13=Team Details** on Bundle Booking screen 2 to display the Team Details window.

Material Details Window (F14)

Use this window to:

- Override the operation sequence, quantity and issuing stockroom and standard material requirements.
- Record additional, unexpected material usage.
- Record set up and indirect overhead material usage.

For more details, refer to the Production Order Booking option.

Select **F14=Materials** on Bundle Booking screen 2 to display the Material Details window.

Inventory Receipts Window (F16)

Select **F16=Receipt Details** on Bundle Booking screen 2 to display the Inventory Receipts window.

Note: If the planned receiving stockroom is warehouse controlled, then this window displays automatically.

This window is fully described under the Production Order Booking option.

Scrap WIP Details Window (F17)

Use this window to enter details of the reasons for scrapping the items quoted on the Booking Details screen.

For more details, refer to the Production Order Booking option.

Press **Enter** on the Product Distribution Total window to display the Scrap WIP Details window.

Note: This window only displays if you have entered a quantity in the Scrap field on Bundle Booking screen 2.

Held WIP Details Window (F18)

Use this window to enter details of the reasons for scrapping the items quoted on the Booking Details screen.

For more details, refer to the Production Order Booking option.

Press **Enter** on the Product Distribution Total window to display the Held WIP Details window.

Note: This window only displays if you have entered a quantity in the Held field on Bundle Booking screen 2.

Subcontract WIP Shipper

6/P4T

Use this option to:

- Ship WIP to subcontractors.
- Return unsatisfactory inventory for rework.
- Correct errors in previous shipment documentation by processing a reversal.
- Accept returned inventory from the subcontractor.

Tip: The level of validation invoked by the procedure depends on the setting of the Shipper Tracking flag on the Organisational Model that determines whether shipments and receipts are to be tracked by shipper number (despatch note) and shipping documentation (notes) produced.

If recording the shipment of rework, which must be actioned from the operation prior to that designated subcontracted, then the quantity to be shipped must be equal to or less than the quantity defined as held at the subcontracted operation. Shipping rework reduces the held quantity at the next operation.

This screen is only used to record the shipment of WIP. If materials are being sent with the WIP then they should be recorded using the *Issue Materials* function **after** using this function.

Select Subcontractor WIP Shipper on the menu to display the Subcontractor Shipper/Return Entry screen.

F19=Shipper Details

06-23 **SF** MW KS IM II KENB20A PET166S2

Fields:

Shipper Header

Date

Enter the date on which WIP inventory is to be/was shipped. An entry is mandatory. The system defaults to the current date.

Shift

Optionally, enter the shift from which the item(s) is to be shipped. This provides a more precise time frame for recording the shipment on the stated date. Shift profiles are defined as part of the system implementation and may be specified for each machine.

WIP Location

The WIP inventory balance to be updated when items are shipped. A WIP location may indicate a physical or a logical area of the shop floor, and is defined as being a stockroom.

If a WIP location is not entered, following validation of all other prompted details and pressing Enter the system assumes and displays the default location associated with the operation.

Several WIP locations may be valid for an operation if work is booked against non-standard (not route designated) machines with dissimilar WIP locations.

If WIP Lot Tracking is in use, and the balance at this location is not compatible with the shipment requested, that is, there is insufficient inventory, an error message is displayed and continuation prevented.

Subcontractor

Enter the subcontractor to whom the inventory is to be shipped.

If no entry is made, the system displays the subcontractor defined for the style/route/operation.

Shipper Number

Each subcontractor or shipment may be referenced by a shipper number if the Shipper Tracking flag on the Organisational Model is set to require it.

When required, and recording receipts from the subcontractor, the relevant shipper number must be quoted, and this is used to validate the receipt against the quantities shipped.

An entry may be made manually, or generated by the system when Enter is pressed after all fields have been prompted. The last number used is displayed on the Organisational Model.

A duplicate number may be entered against a range of items, operations or orders, if multiple despatches to the same subcontractor are to be recorded on the same shipment, and printed on the same document (shipper note).

Ship Via

If Style Purchase Management ship via codes have been set up, one may be chosen to indicate the method of transport, or the transporter, used to move the shipment.

Shipper Details

Order

Enter the production order number against which the shipment is to be recorded. Once an order and operation are entered, F16 may be pressed to review the WIP inventory balances at the operation; this includes any associated WIP locations.

Operation

Enter the operation number prior to that defined as subcontracted if the item(s) is being shipped for the first time.

Note: If the item(s) is to be reworked, then the subcontracted operation should be specified. A review of the stock status available via F16 is not allowed until the Rework Indicator is set to 1 (yes)

Lot Number

If the item being shipped is lot controlled, and WIP Lot Tracking is enabled, enter the lot to be shipped. The number and quantity to be shipped must already have been booked at the operation prior to shipping.

PO Number & Line Number

Enter the purchase order number against which the shipment is being made. This is validated against orders in the Style Purchase Management application. A line number on the order must be entered. This is validated.

If no entry is made, the system defaults to the PO Number and PO Line Number created during Order Release

Quantity

Shipped

Enter the quantity to be shipped.

Due Date

Enter the date when completion and return from the subcontractor is expected. The due date is displayed on enquiries and printed on reports. Entry is optional.

Rework Indicator

If the inventory is being returned to the subcontractor because it is faulty or does not meet quality standards but can be reworked, then this should be indicated by this flag.

0 - Item is being shipped for the first time (default)

1 - Item is to be reworked. The system checks that there is sufficient held quantity at the receiving operation to warrant the return. An error message is displayed if there is insufficient to ship.

Reversal

This field can be used to correct an error made in a previous shipment detail, or to book back inventory that was not used by the subcontractor.

0 - Item is a standard shipment.

1 - The booking is to be a corrective or returns transaction.

Functions:

F16

Display shows WIP inventory at an item/operation

F19

Amend booking details

System Updates:

When **Enter** is pressed, the system validates each field and prompts at any that are invalid, and display an informative error message. When **Enter** is pressed again, the system opens a Booking Details Summary window, transferring the shipments defined and allows entry of further shipments in the same manner as booking time and work-in-progress. **F8** must then be used to save all entries made to-date.

To return to the window to amend or delete a line, use F19.

Progress at Subcontractor

7/P4T

Use this option to progress WIP from operation to operation when consecutive subcontracted operations have been defined on the route/BOM. WIP inventory is only received from the subcontractor using the Receive from Subcontractor routine.

Completing An Operation Short

This function allows you to complete an operation where the total quantity booked over all transactions is short. It is assumed that any held quantity will be released and is therefore included in the new planned production order quantity. For example:

Planned quantity: 100

Operation: Complete: 60

Operation: Held: +20

New PO planned quantity: 80

Rework activities are ignored.

When an operation is completed short and the quantity adjustment conditions are met, Style automatically updates planned production order quantities and recalculates durations and work station loadings. The adjustments take account of:

- Wastage on both material and operations.
- Sales order reservations on production orders.
- Raw material allocations on inventory and lot inventory.

Note: Sub-contracted operations may only be completed short and not over.

Select Progress At Subcontractor on the menu to display the Subcontractor Progress Entry screen.

Fields:

Header Details

Date

Enter the date on which WIP inventory is to progressed. An entry is mandatory. The system defaults to the current date.

Shift

Optionally, enter a shift. This provides a more precise time frame for recording the progression on the stated date.

WIP Location

This is the WIP inventory balance that is to be updated when quantities are entered. This is the subcontractor balance at the WIP location.

Subcontractor

Enter the subcontractor carrying out the operation.

Progress Details

Order

Enter the production order number.

Operation

Enter the operation to report.

Lot Number

Enter a lot number if WIP Lot Tracking is required.

Shipper Number

Enter the original shipper number if Shipper Tracking is being used.

Quantity

Total

Enter the quantity available for progress to the next operation.

Scrap

Enter any scrap quantity.

Reason

Enter a scrap reason code if a scrap quantity has been entered.

Op Complete

The operation may be flagged as complete if no more quantities are expected to be booked.

Note: For a completed operation, if the following two conditions are met, then the quantity completed is marked as short:

1. The operation is marked as one that requires production order adjustments. This is achieved by setting the Operation Type for this operation to 8 on the Additional Operation Values window in Style Definition Management.

2. The quantity completed falls outside the complete tolerance given in the CTOL parameter. The calculation assumes that any quantity held will be released and therefore included in the new production order quantity. To find out more about the CTOL parameter, refer to Style Definition Management.

Marking the quantity as short has the effect of recalculating durations, allocations, reservations, material requirements and machine loading.

This may be done on both planned and unplanned complete short operations.

Functions:

F14

Material Details. Opens the Material Details window, from which you can specify backflushed materials explicitly. Otherwise, Style determines backflushes as standard usage from the route/BOM.

F19

Amend booking details.

Material Details Window (F14)

Use this window to:

- Override the operation sequence, quantity and issuing stockroom and standard material requirements.
- Record additional, unexpected material usage.
- Record set up and indirect overhead material usage.

For more details, refer to the Production Order Booking option (2/P4T).

Select **F14=Materials** on the Subcontractor Progress Entry 2 to display the Material Details window.

Receive from Subcontractor

8/P4T

This option provides the booking-in routine for receiving WIP inventory from a subcontractor.

Completing An Operation Over Or Short

This function allows you to complete an operation where the total quantity booked over all transactions is either over or short. It is assumed that any held quantity will be released and is therefore included in the new planned production order quantity. For example:

Planned quantity: 100

Operation: Complete: 60

Operation: Held: +20

New PO planned quantity: 80

Rework activities are ignored.

When an operation is completed over or short and the quantity adjustment conditions are met, Style automatically updates planned production order quantities and recalculates durations and work station loadings. The adjustments take account of:

- Wastage on both material and operations.
- Sales order reservations on production orders.
- Raw material allocations on inventory and lot inventory.

Tip: The level of validation invoked by the procedure depends on the setting of the Shipper Tracking flag on the Company Profile. This determines whether or not receipts are to be tracked by shipper number such that any receipt must relate to a recorded shipment (shipper number).

Subcontracted work is received into operations defined as subcontracted, and WIP inventory balances at that operation are updated accordingly.

Select Receive From Subcontractor from the menu to display the Subcontractor Order Receipts Entry screen.

5-23 **SR** MW KS CL IM DM II STUD140 KB PED201S1

Fields:

Advice Note Header

Date

Enter the date on which WIP inventory was received. An entry is mandatory. The system defaults to the current date.

Shift

Optionally, enter the shift during which the item(s) was received. This provides a more precise time frame for recording the receipt on the stated date. If entered, this should be a shift number on the shift profile in force on the receipt date at the machine defined at the subcontract operation.

WIP Location

This is the receiving WIP location; this should be the location defined for the default machine entered on the production route for the subcontracted operation; not the prior operation from which the inventory was originally shipped.

If WIP Lot Tracking is in use, and the receipt quantity is not compatible with the shipment inventory, that is, there is insufficient inventory, an error message is displayed and continuation prevented.

Subcontractor

Enter the subcontractor from whom the inventory has been received.

If Shipper Tracking is effective, then the quantity received against a subcontractor/order/operation/shipper number must be less than or equal to that recorded as shipped. An error message is displayed if a quantity in excess of that recorded as shipped is entered.

If no entry is made, but an order, operation and shipper number entered, the system defaults to and accepts the subcontractor entered at shipment time.

Advice Note No.

This is a free format field used to record the document number accompanying the received items; this would usually be an advice note or despatch note. The number is printed on reports and displayed on enquiries to identify the receipt.

Advice Note Details

Order

Enter the production order number to which the receipt quantity relates.

Operation

Enter the sequence number of the subcontracted operation.

Lot Number

If the shipment was lot controlled, enter the lot number of the original consignment.

If the Key Operation flag on the operation was set to 3 (raise a purchase order for subcontracted work, and prompt for lot number) then the system enables you to change the lot number, irrespective of WIP Lot Tracking. This enables you to track specific lots returned from a subcontractor. The new reference must be used at subsequent operations.

PO Number

Enter the purchase order number against which the work was carried out.

PO Line Number

Enter the corresponding line number on the purchase order.

Ship Close

Indicates whether this receipt is the last shipment to be recorded against the entered shipper number.

0 - More receipts are expected.

1 - No more receipts are to be recorded and details of the shipments may be purged from the system via the Subcontractor Shipper Clearance utility.

Quantity

Total

Enter the quantity of items received in satisfactory status, that are then available for the next operation.

Scrap

Enter any scrap quantity. This is added to the good quantity when determining material usage.

Reason (Scrap)

Enter a reason code to classify why the item was scrapped.

Codes are defined on the Style Inventory Management, descriptions file against type MOVR

Held

Enter any held quantity. If items are subsequently reworked, this figure is reduced by the rework quantity so that on completion it can be received once more.

If the Held WIP Tracking flag on the Organisational Model is set to 1 (yes), once a held quantity has been entered, a held details reference must also be entered.

Held quantities can be released by the Release Inventory option (2/P4W). Releasing held WIP makes it available for further operations. Alternatively, held WIP can be scrapped via the Scrap Held Inventory option (3/P4W).

Reason (Held)

Enter a reason code to classify why the item is being held.

Codes are defined on the Style Inventory Management, descriptions file against type MOVR

Op. Complete

This flag should be set when all receipts relating to this operation on this order have been received.

Note: For a completed operation, if the following two conditions are met, then the quantity completed is marked as Over or Short as appropriate:

- 1. The operation is marked as one that requires production order adjustments. This is achieved by setting the Operation Type for this operation to 8 on the Additional Operation Values window in Style Definition Management.*
- 2. The quantity completed falls outside the complete tolerances given in the CTOL parameter. The calculation assumes that any quantity held will be released and therefore included in the new production order quantity. To find out more about the CTOL parameter, refer to Style Definition Management.*

Marking the quantity as over or short has the effect of recalculating durations, allocations, reservations, material requirements and machine loading.

This may be done on both planned and unplanned complete short/over operations.

Order Complete

If the subcontracted operation is the final operation on the route, then the order may be flagged as complete.

Reversal

This field can be used to correct an error made in a previous receipt.

0 - Standard receipt

1 - The booking is to be a corrective transaction.

Functions:

F14

Material Details. Opens the Material Details window, from which you can specify backflushed materials explicitly. Otherwise, Style determines backflushes as standard usage from the route/BOM.

F19

Amend booking details.

Material Details Window (F14)

Select **F14=Materials** on the Subcontractor Order Receipts Entry 2 to display the Material Details window.

Use this window to:

- Override the operation sequence, quantity and issuing stockroom and standard material requirements.
- Record additional, unexpected material usage.
- Record set up and indirect overhead material usage.

For more details, refer to the Production Order Booking option (2/P4T).

System Updates:

On receipt, any material requirements used by the operation are backflushed out of the subcontractor stockroom; standard quantities are assumed unless manually overridden.

If the subcontracted operation is the last operation on the route and consequently the output from it is finished inventory; then that too is booked as standard unless manually overridden. The option is also given to close an order if it is the final operation on the route.

Quantities booked held may be reworked by re-shipping via the Subcontractor WIP Shipper facility.

When **Enter** is pressed, the system validates each field and prompts at any that are invalid, and displays an informative error message.

When **Enter** is pressed again, the system opens a Booking Details Summary window, transferring the receipts defined and allow entry of further receipts in the same manner as booking time and work-in-process. **F8** must then be used to save all entries made to-date.

To return to the window to amend or delete a line, use **F19**.

On update:

- A transaction with an activity type of SUBCRC (subcontractor receipt) and reporting type 21 (subcontractor receipt) are generated.

Detail Level

Only prompted on the report. Indicates the level of detail required.

Inventory Receipts Window

If the planned receiving stockroom is warehouse controlled, then this window displays automatically.

This window is fully described under the Production Order Booking option.

Transaction Enquiry

11/P4T

Use this option to enquire upon transactions.

You can review transactions entered on a specific date, by a particular user or all users.

Where an operation has been booked over or short, you can view the new style and SKU planned quantities:

- The changed quantities displayed may not be accurate if transactions are being processed at the time the quantity change activity QTYCHG is written. Use the quantities displayed for information only and not for calculating the new planned quantity.
- The quantities shown do not include any quantity adjustments on the route subsequent to the operation.

Transaction Input Enquiry Screen 1

Use this screen to specify the selection parameters for the display. On completion of the selection parameters, a summary enquiry screen is shown that gives access to detailed screens.

Select Transaction Enquiry on the menu to display Transaction Input Enquiry screen 1.
