Glossary

Glossary

Allocated (Stock)

The quantity of a part which has been allocated to customer or works orders. It is usually expressed as a **balance** at **part/stockroom** level.

Alternative (Part)

A part which can be used as an alternative to another.

Available (Stock)

The quantity of a part which is available for issue. It is usually expressed as a **balance** at **part/stockroom** level.

Average Cost

The average cost of a part in a stockroom. This is recalculated every time a receipt is made.

Average Usage

The average **usage** per week/period of a part in a stockroom. The weeks or periods which are included in this calculation are defined by the **usage profile**.

Back Order

The quantity of a part which is required for customer orders which cannot currently be satisfied from stock. It is usually expressed as a **balance** at **part/stockroom** level.

Balance

This may be used either to signify a database record holding summary information, such as a **stockroom balance**, or a single summary quantity field on such a record, such as **allocated stock**.

Batch Control

This is a level of stock control at a more detailed level than **part/stockroom**. See also **lot** control.

Batch/Lot Traceability

Where stock control is specified at **batch** or **lot** level, this refers to the ability to trace the movement of stock at this detailed level.

Carton

An item code which describes a collection of piece items, of various colours/sizes/fittings, but with the same style code. The stock can be moved (i.e. purchased, stocked, issued) as a carton or as individual pieces.

Cost

A value associated with a part in a stockroom, or a movement. It is usually a value related to a single part (a unit cost), but may refer to a quantity of parts (a movement cost or value).

Costing Method

This refers to the method used to establish a **cost** for **movements** or stock **balances**. The methods available are **latest**, **average**, **standard** and **FIFO**.

Descriptions File

This is a file maintained within the Inventory Management Application which defines a number of parameter codes and their descriptions.

Economic Order Quantity

This is an optimum quantity of a part to be ordered on a single occasion. Its calculation is based on the usage of the part, the cost of order placement and the cost of carrying the part in stock.

Expected (Stock)

The quantity of a part which is expected will be available for issues on a given date. This is usually expressed as a quantity for a **part/stockroom**.

FIFO

This is an acronym for 'First In First Out' - one of the costing methods available in the Inventory Management application. By this method, each stock receipt is valued at actual cost, and issues are valued using these receipt batch costs on a First In First Out basis.

Frozen (Stock)

The quantity of a part which is not available for issue (and not **allocated**). It is usually expressed as a **balance** quantity at **part/stockroom** level.

In Transit

The quantity of a part which is currently in transit between two **stockrooms**. It is usually expressed as a **balance** quantity at the target **part/stockroom**.

Latest Cost

The last cost at which a part was received into a **stockroom**. One of the costs maintained at **part/stockroom** level.

Lead Time

The standard amount of time, in weeks, from a decision to order a part for a stockroom, to the part being received in the stockroom.

Lot Control

This refers to a level of stock control lower than **part/stockroom**. May also be known as **batch control**.

Maximum Stock

The maximum quantity of a part in a stockroom preferred by the user. This may be set manually, or automatically calculated by the system.

Movement Type

This refers to the classification of movements by type of transaction, i.e. miscellaneous receipts, customer order issues.

On Order

The quantity of a part for which outstanding purchase or work orders exist. It is usually expressed as a **balance** quantity at **part/stockroom** level.

Order Placement Cost

The cost in base currency of placing and processing a purchase order. This is used in the calculation of **economic order quantity**.

Part

The single term used to describe an element of stock identified by a unique number.

Part/Stockroom

This is the main level at which **costs** and **balances** are held within this application. The part/stockroom record also defines **stock management** rules for a part in a stockroom.

Product Class/ Product Group/ Product Type

These are the main analysis categories in which like products be grouped together. Selection and sequencing on many reports is provided by these categories.

Physical (Stock)

The total quantity of a part in a stockroom. It is usually expressed as a **balance** quantity at **part/stockroom** level.

Reorder Point

The quantity of a part in a stockroom which, when reached, should trigger a reorder action. This may be set manually or calculated by the application.

Reorder Policy

The policy adopted to control the reorder of parts - may be either ROP/MAX, ROP/ROQ, or Up to ROP.

Reorder Quantity

The quantity of a part recommended for reorder when **reorder point** is reached for the part in a stockroom.

Reorder Quantity Factor %

The number of lead times worth of average usage to be reordered, expressed as a percentage.

Serial Number Control

A form of **batch** or **lot control**, but exercised at a single, unique element level, (not supported by style).

SKU

Stock Keeping Unit. The SKU represents the lowest level of definition for a style whether that be a simple one dimension or four dimensional product. For example, a item with an assigned style with colours, fittings and sizes is a four dimensional product. Together, these dimensions constitute the SKU and differentiate it from other items.

Standard Cost

This unit **cost** of a part in a stockroom, specified as a standard by the user for a defined period. Standard costing is one of the available **costing methods** within the application.

Stock Carrying Rate %

The percentage cost of carrying a stock part for a year. This rate is used in **Economic Order Quantity** calculations.

Stock Count

A periodic verification of the accuracy of computer-held stock figures by a physical count of stock.

Stock History

A summarised view of **stock movements** per week or period.

Stock Management

A movement of a quantity of a part into or out of a **stockroom**. More particularly, this will refer to the recording of such a movement in the application, and the transaction record created as a result.

Stockroom

A discrete area of a company where stock is recorded and controlled separately from other company stocks.

Stockroom Balance

See **balance** and **part/stockroom**.

Style

The apparel describer of a group of like parts controlled by a main identifier, grouping, i.e. style.

Tolerance

Tolerances are defined against the stockroom and define the upper and lower variances (by quantity percentage and value), that will be allowed for stock discrepancies for items counted within the stockroom.

Percentage variances for a balance are defined as follows:

Value variances are defined by valuing the quantity variance according to the unit cost of the associated item:

$(\text{Counted Quantity} - \text{Computer Quantity}) \times \text{Cost}$

Cost=costing method applied to the item.

Discrepancies for FIFO costed items are valued at latest cost.

Unit of Measure

The unit in which a quantity or **unit cost** is expressed.

Usage

The quantity of a part issued from a **stockroom** in a given period.

Usage Profile

A user-defined profile which specifies the pattern of periods to be included in the calculation of **average usage**.
