Chapter 2

Maintain Applications

New Applications

Users can create their own applications with user-defined tasks and menus, for example an operator's menu with options to save libraries, clear output queues and run day-end procedures.

Note: If you intend to use the application for development purposes then you must create it using IPG/400, IRG/400 or VIEWfinder.

Creating a new application involves several steps:

Application Profile

Firstly, inform Application Manager of the existence of the new application. This requires:

- Application Source 1 character.
- Application ID 2 characters.
- Environment 3 characters
- Release Level 2 characters.

Note: If the application is to be part of your live system then use your personal environment code, see the Execute Applications section.

Set this up via the Maintain Application Screen.

Library List

For each new application you must have entered a library list code. Create this library list using the Maintain Library Lists option (see the Maintain Library Lists section).

Application-Defined Tasks

Specify the tasks which need defining to the application. They can be user-defined but this does not allow for exclusivity checking. To define tasks, use the Maintain Tasks option (see the Maintain Tasks section).

Menus

Decide the menu structure that you wish to define. Then use the Maintain Menus option (see the Maintain Menus section).

Companies

If your application is to be company-driven, then make sure the companies are defined. Use the Maintain Companies option (see the Maintain Company Parameters section of the Administration Functions Product Guide).

User Profiles

Finally, authorise users to your new application. You must authorise them to menus (options, functions keys), tasks and companies. Use the Maintain User Profiles option.

Note: If you first create the application using a test environment code and then want the application to be part of your live environment, use the Application Gold Copy utility (see the Gold Copy section and the Tips And Techniques chapter) to copy the environment.

Maintain Applications

Each software module which runs under Application Manager is known as an Application.

In order to establish the required library lists, procedures and menus associated with the application, each application needs an Application Profile.

For all applications, the Application Profile is already set up. It is recommended that this is not changed.

Select Application Window

To display this window, select option 1 from the Main Menu and press **Enter**.

This windows displays a list of all the applications set up on your system.

*Note: If you already selected an application using **F22=Select Application**, when you select option 1 from the menu the Maintain Applications Screen is displayed.*

XA200
Application Manager
System: STUDB30A

Main Menu

1. Maintain Applications
2. Maintain Library Lists
3. Maintain Tasks
4. Maintain Menus
5. Operational Enquiries
6. Documentation
7. Utilities
8. Execute Application Man
9. Exit

Selection or command
=>

F3=Exit
F10=Command Entry
F4=Prom
F12=Pre

Select Application

Position List To: _ _ _

Type option, press Enter.
1=Select Application

Op	ID	Env	RI	Application Text
_	IN			03 Inventory Management.
_	GL			03 General Ledger.

Bottom

F8=Create Application
F12=Cancel

Fields:

Position To

Enter the application from which you want to start the display.

Op

Selection field. Enter 1 alongside an application to display more details.

ID

The two character identifier for the application.

Env

The environment code of the application.

RI

The release level of the application.

Application text

The Application Manager description of the application.

Select an application profile with option 1. Or select **F8=Create Application** to create a new application profile. The Maintain Application Screen is displayed.

Maintain Application Screen

Use this screen to create and amend applications.

The screenshot shows a terminal window titled 'Application Manager' with 'System: MARVIN' in the top right. The main title is 'Maintain Application'. In the top right corner, there is an 'Action' field with the value '*ADD'. The main area contains a list of fields with underscores indicating where to enter data:

- Source _
- ID _
- Environment . . . _
- Release _
- Library list code _
- Description . . . _
- Day end program . _
- Company validation _
- Menu style _ 1=Window, 2=Conventional
- Help window type . _ 0=Standard, 1=Reverse image

At the bottom, there is a status bar with function key shortcuts: F3=Exit, F10=Additional details, F14=Classes, and F12=Previous. The bottom left shows 'MA a' and the bottom right shows '07/026'.

Fields:

Note: You can only maintain the Source, ID, Environment and Release fields if you are creating an application.

Source

Identifies the source of the application.

Note: If you enter a source code of J or O, you must enter an authorisation code. You can enter any other letter as a source code, without authorisation checking, but it is recommended that U is used for your own applications.

ID

The two-character application ID.

Environment

The environment code for the application.

Release

The release level/version of the application.

Library list code

Defines the initial library list code to use to set up the library list for this application. The library list defined by this code is established when a user first enters the application, except where a library list code is specified at task level.

Description

The Application Manager description of the application.

Day end program

The name of the program processed by Application Manager day-end routines. For more details of the Application Manager day-end process see Day-End Parameters.

Note: Machine Manager contains a standard job to run the Application Manager day-end process. To make sure day-ends are run regularly, you must set this up as a Machine Manager day-end job. For more information see the Machine Manager product information.

Company validation program

The name of the program to be used to validate the company code on initial entry into the application. See the Company Validation Program section.

Menu style

- 1 - For window style menus.
- 2 - For conventional menus.

This controls the style of menus created within the Maintain Menus function. See the Maintain Menus section.

Help Window Type

Blank - Normal help text windows

- 1 - Reverse image windows.

Functions:

F10

Additional Details. Displays extra fields. These fields are for Ratioplan users only and are documented in the Ratioplan documentation.

F14

Classes. No longer supported.

Press **Enter** to confirm your selections.
