Chapter 8

Explorer Window Recognition

What Is Window Recognition?

Warning: Window Recognition is for the System Administrator only.

Window Recognition enables the System Administrator to fix minor screen issues where a pop up window in the application software appears incorrectly.

When a window displays incorrectly the Window Recognition Utility determines whether there is an alternative to the pop up recognition algorithm used by Explorer. It stores details of magic numbers and window co-ordinates in a text file. This file is then loaded by the emulator at runtime and used to process the screens correctly.

Window Recognition is delivered with Explorer as part of Administration Tools. Please refer to the Technical Information Help file for more information about installing.

Access

You can access Window Recognition in two ways:

- From your JBA System 21 program list. If you install JBA's Administration Tools product then Window Recognition is displayed as an option on your Program Menu as well as Explorer.
- From the User's Right Click Menu on the application window.

You cannot gain access directly from Explorer's menus or windows.

To enable the Window Recognition utility you use Explorer's System Configuration Settings Window and check the box called Manual Window Configuration.

File

The utility uses the text file Lueinfo.cfg. You can have a different file for each application version of Explorer.

Tutorial

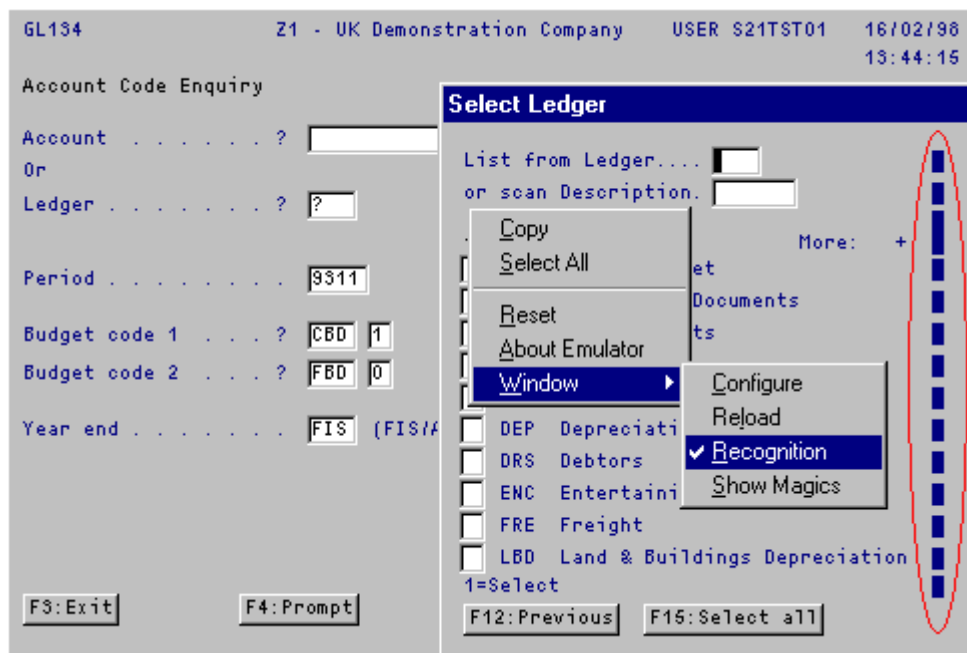

These are the steps in the process:

Step 1

Using System Configuration, go to the System Configuration Settings Window and check on the Manual Window Configuration box. This changes the ManualWindowConfiguration= setting in jbasmg.ini from 0 to 1.

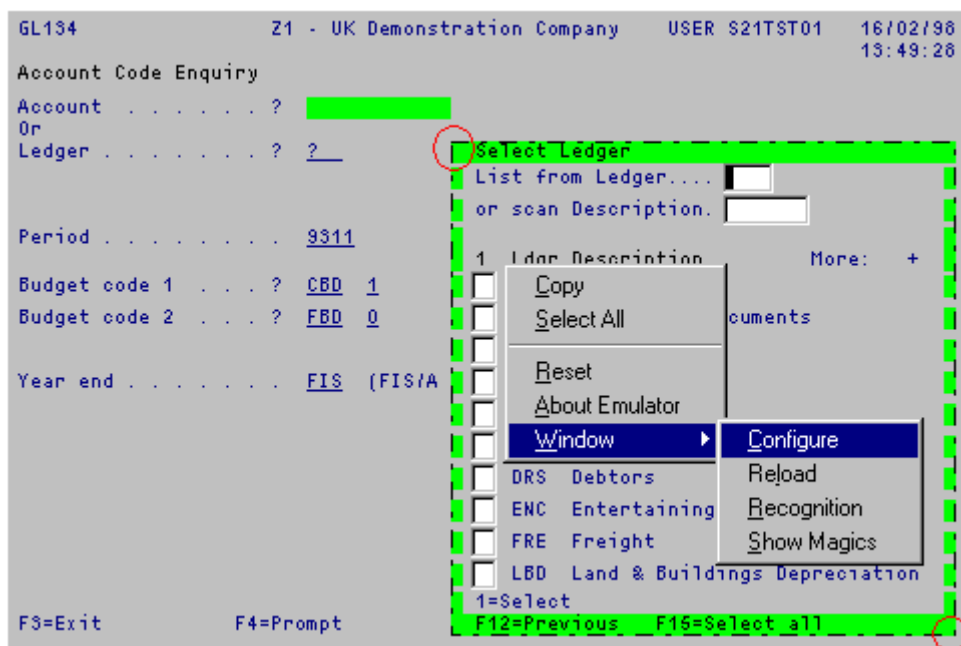

Step 2

Go to the application window where the problem is happening. Right click to display the context sensitive pop up menu, select the Window option and turn off Recognition.

Step 3

Return to the problem window and you will see the Window goal posted. Using the right mouse button, draw a box, with dotted lines, around the window, making sure you exactly match the top left and bottom right hand corners. This box is the part which will be re-displayed for you.

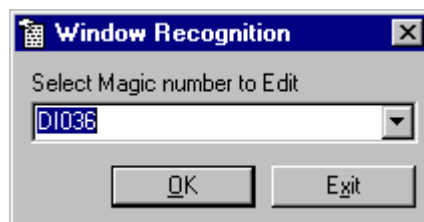

Step 4

Select Window, and then Configure, on the pop up menu. This runs the Window Recognition Utility. These details are passed to the program:

- The path to Lueinfo.cfg (the file you are about to edit)
- The Magic Numbers and co-ordinates for the problem window.

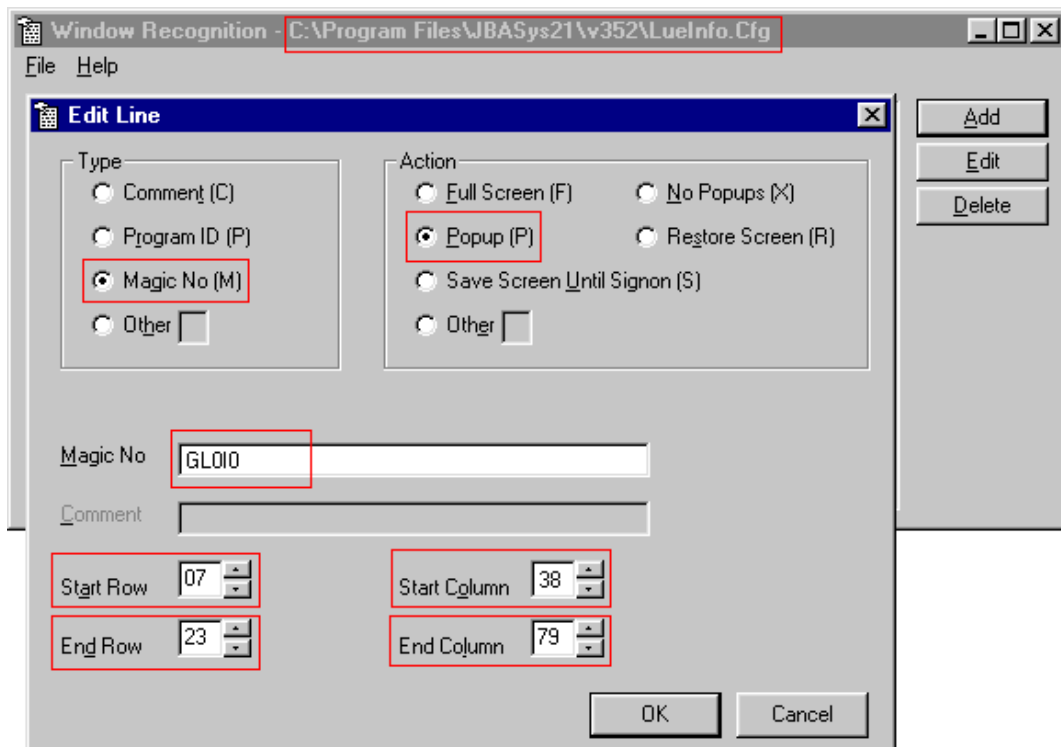

Step 5

If the window has more than one Magic Number then the Window Recognition Select Magic Number Window displays. You select the one you want for this window configuration.

Step 6

Depending on whether or not there is an existing configuration for the problem window, you can add, edit or insert details. The co-ordinates for the box which you drew are displayed for you.

Step 7

Select OK. Then select Save from the File Menu to save Lueinfo.cfg.

Select Exit from the File Menu.

Step 8

Select Window, and then Reload, on the pop up menu.

Select the Window option on the pop up menu and turn Recognition back on.

Press **F12** and re-enter the problem window and the display should be correct.

User's Right Click Menu

The Explorer user has a context-sensitive pop up menu available when clicking with the right mouse button on any space on an application window.

If the Manual Window Configuration box on Explorer's System Configuration Settings Window has been checked, then the user has a Window option on the pop up menu. There are four sub-options as described below:

Configure

This calls the Window Recognition Utility and displays the Window Recognition Menu Window. If there is more than one.

Reload

The emulator reloads the configuration file (Lueinfo.cfg) into memory. Do this if you want to see immediately if there have been any changes in the configuration.

Recognition

Enables/Disables window recognition. This means, do you want to use what is in the Window Configuration file or not:

- If this option is checked then Explorer uses the contents of the Window Configuration file (Lueinfo.cfg) to create a window, provided that a record exists.
- If this option is unchecked then Explorer ignores the Window Configuration file (Lueinfo.cfg).

You can switch this off but still use the Configure option.

Show Magics

Displays a Magic Number on each application window.

Window Recognition Menu Bar

Note: The Window Recognition Menu Bar is displayed with the Window Recognition Window.

The Window Recognition Menu Bar has two drop down menu options:

- File Menu
- Help Menu.

File Menu

Menu options:

Open

Displays the Open Window Configuration File for you to select a file. The default is to select:
c:\Program Files\JBASys21\v352\Data\Lueinfo.cfg.

Save

Save the file with any changes you have made.

SaveAs

Save a copy of the file with a new name.

Search

Displays the Search Window for you to enter a Magic Number, Program ID or comment. When the search is complete the number you asked for is highlighted on the grid box.

Exit

Close Window Recognition without saving any changes.

Help Menu

Menu options:

Window Recognition Help

Help for this utility.

About

Displays System 21 version information.

Window Recognition Windows

Note: The Window Recognition Menu Bar is displayed with the Window Recognition Menu Window.

The following window sections give you detailed information about using the Window Recognition facility.

Window Recognition Add/Edit Line Window

To display this window select the Add or Edit button on the Window Recognition Menu Window.

You can add or edit a line of window configuration details. The changes you make are reflected in the list on the Window Recognition Menu Window.

Fields:

Type

Select the type of identification for the window configuration detail:

- Comment (C) This enables the Comment field below
- Program ID (P) This enables the Program ID field below
- Magic No (M) This enables the Magic No field below
- Other. You enter the letter for the Type in the box alongside the option button. This enables the Other field below.

Action

Select the method for displaying the configured window:

- Full Screen (F) Display the configured window as full screen size.
- No Pop Ups (X) This has the effect of turning Window Recognition off for one screen only.
- Popup (P) Display the configured window on top of the original window.

- Restore Screen (R) Some screens have been recognised by JBA as needing special attention. You can recognise these by the R in the Action column. All you need to do with these is to make sure you don't change this Restore option in the Action field.
- Save Screen Until Signon (S) Only display this new window at sign on.
- Other. Reserved for future enhancements.

Note: The remaining fields on this window are enabled depending on your choice of Type and Action.

Magic No

Exactly five alphanumeric characters.

This field is enabled only if the Type field has the Magic No option selected. Identify the window by entering a Magic Number.

Program ID

Between one and eight alphanumeric characters.

This field is enabled only if the Type field has the Program ID option selected. Identify the window by entering a Program ID number.

Other Type

Between one and eight alphanumeric characters.

This field is enabled only if the Type field has the Other option selected. Identify the window by entering a comment .

Comment

Between one and 17 alphanumeric characters.

This field is enabled only if the Type field has the Comment option selected. Identify the window by entering a comment.

Start Row/End Row/Start Column/End Column

These four fields are enabled only if you select an Action of Pop Up or Other.

You must make the End Row greater than the Start Row and the End Column greater than the Start Column.

Rows must be 01 to 24.

Columns must be 01 to 80.

Buttons:

OK

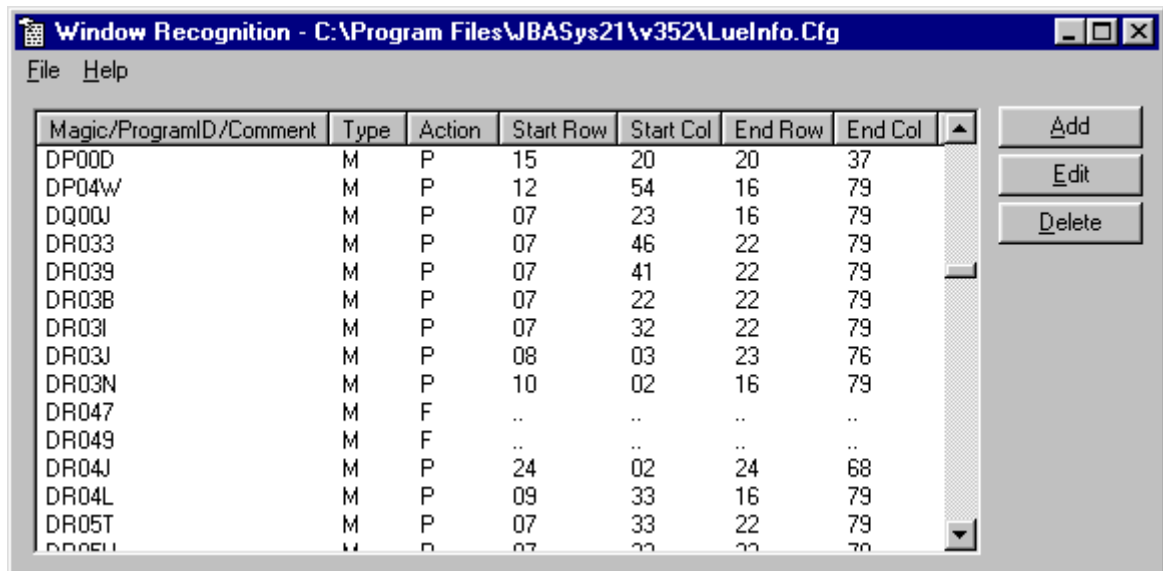

Save LueInfo.cfg and close the window.

Cancel

Close the window without saving the changes.

Window Recognition Menu Window

 To display this window select Window Recognition from the JBA System 21 program list.

This window enables you to maintain a list of window configurations in the Lueinfo.cfg file.

 **Note:** The Window Recognition Menu Bar is displayed with the Window Recognition Menu Window.

 **Warning:** Remember to select Save from the File Menu.

There is a grid box displaying a row of details for each window configuration. Each window is identified by a Magic Number, a Program ID number, a Comment, or another name, which you enter yourself as Other.

To maintain these details you select a row and then select either the Add, Edit or Delete button. This takes you to the Window Recognition Add/Edit Line Window.

Buttons:

Add

Displays the Add Line Window. You enter details to add a new entry to the list. The entries are displayed on order from 00000 through to ZZZZZZ.

Edit

Displays the Edit Line Window. You amend details for the currently selected entry.

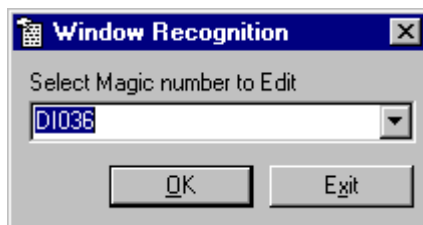

Delete

You are asked to confirm the deletion of the currently selected entry.

Window Recognition Select Magic Number Window

This window displays if you configure a window for which there is more than one Magic Number assigned.

You select the Magic Number you want for this window configuration.

Fields:

Select Magic Number To Edit

Select a Magic Number from the drop down list box.

Buttons:

OK

Save the Magic Number and close the window.

Exit

Close the window without saving the changes.
