Glossary Of Terms

Glossary

Client

The Client is the PC, an intelligent terminal which sends data to, and receives data from, the Server/Host.

Clipping

Clipping is the term used to describe the way in which lines can be trimmed from the top and bottom of the screen display.

Host

The Host is a term sometimes used to describe the Server - the main platform on which the Database resides - which sends data to, and receives data from, the Client (PC).

Keyboard Buffering

The term used to refer to typing ahead whilst waiting for a command to execute. This is not available in this version of JBA System 21.

Magic Number

An alternative name for the unique Display File Screen Identifier, used as the reference point to which to attach all screen definitions.

Screen

A screen is contained by a System 21 Client Workspace window and is part of an application.

For example the Purchase Management company profile screens are contained by Client Workspace windows. The importance of this is that the Purchase Management company profile may be made up of many screens, but only one window, which will consistently display Purchase Management Company Profile in its title bar, whatever titles each screen may have.

Server

The Server is the main platform on which the Database resides - which transfers data to the Client (PC).

SQL

Structured Query Language. A type of programming language used to select data from databases.

Window

The base object of the Windows operating system. A rectangular area on your screen in which you view a document or application. You can open, close and move windows and change the size of most windows. You can open several windows at a time and you can often reduce a window to an icon or enlarge it to fill the desktop.

Workspace

JBA Workspace is the term used to describe the System 21 Graphical User Interface. This is documented in the Client Workspace product guide.

Workspace Designer

JBA Workspace Designer is the software application which enables you to tailor the System 21 Screen display.
