Chapter 3

Installing System 21 Constructor

Product Information

The software is available on CD-ROM.

This is what is shipped:

- System 21 Constructor
- System 21 Constructor Help
- EPM (SCOR models)
- Samples.

Authorisation Codes

No authorisation codes are required for this version of the software.

Hardware Requirements

Hard disk with at least 20.6 Mb available.

Software Requirements

Constructor assumes that you have previously installed JAB System 21 Explorer.

Please refer to Software Requirements for Explorer.

Installing The Software

*Note: If you have any part of a previous version of JBA System 21 Constructor on your machine then you need to follow the instructions for **Upgrading The Software**.*

Warning: Constructor will only work if you have previously installed Explorer to the same directory.

*Note: Refer to the ConREADME.TXT file included on the installation CD for details. **Upgrading the Software (PIP upgrade)**.*

This is what to do:

Step 1

From the PC, make sure that Windows has been started.

Step 2

Run Setup.exe from the JBA installation directory to start the installation.

Warning: Do not run Setup.exe from a DOS prompt.

Tip: Online help and instructions are provided during the installation. It is most likely that you will use the default settings displayed and need only click on the Next button to progress through the installation.

Step 3 - Installing JBA System 21 Constructor Window

The readme file is displayed for you to scroll down.

Step 4 - Setup Information Window

The installation software checks to make sure that you have already installed Explorer: first it looks in the default directory C:\Program Files\JBASys21\; and if it cannot find Explorer it then checks the remainder of your hard disk.

Explorer Found?

If the installation software finds a version of Explorer then it installs Constructor into the same directory as Explorer and you continue as explained at Step 5.

Explorer Not Found?

If the installation software does not find a version of Explorer then it displays a message to say that Explorer has not been found. It also displays the pathway for the default directory - C:\Program Files\JBASys21 and displays a browse button. You now have two choices:

- Continue with the installation and install Constructor into any directory on your hard drive and then go on to Step 5. However, you will not be able to use Constructor

unless Explorer exists in the same location. So when the Constructor installation is completed you must then install Explorer, remembering to install it to the same location as Constructor.

- Terminate the Constructor installation and Install Explorer.

Step 5 - Select Components Window

The installation software displays the Select Components Window.

You can choose to install these components:

- Constructor
- Samples
- Enterprise Process Model.

You can view the amount of space used by each component of the installation.

Step 6 - Select Program Folder Window

You can enter your own name for the folder in your program list or accept JBA System 21 and JBA Help.

Step 7 - Start Copying Files Window

A summary of all your selected components is displayed for you to confirm before completing the installation. If you are not happy with the summary then click the Back button as many times as you need and amend any of your installation entries.

Step 8 Setup Complete Window

Note that at the end of the installation, assuming that you previously installed Explorer, you will have in your program list:

JBA Help:

- Technical Information
- JBA System 21 Explorer Help
- JBA System 21 Constructor Help
- Technical Reference Help.

JBA System 21:

- JBA System 21 Explorer
- JBA System 21 Constructor
- System Configuration
- User Role Maintenance
- Character Conversion
- Window Recognition
- Technical Reference
- Currency Download
- Email Server Agent.

You will also have two new directories:

- C:\Program Files\JBASys21\ConSamples containing the samples
- C:\Program Files\JBASys21\EPMvvv containing the Enterprise Process Model. Where vvv is the version number, for example EPM352.

Upgrading The Software (Full Upgrade)

Note: If this is the first time that JBA System 21 Constructor has been installed on your machine then you need to follow the instructions for Installing The Software.

Note: Refer to the ConREADME.TXT file included on the installation CD for details.

Note: If your installation CD specifically says PIP then you need to follow the instructions for Upgrading The Software (PIP Upgrade).).

This is what to do:

Step 1

Note: When you install Explorer and Constructor the installation software keeps a list of any work files which it has installed. The Uninstallation software deletes any files on this list. This means that any files you amend will be deleted but any files which you create will remain. However, JBA strongly recommend that you backup all your files.

Copy away any work files and extracts that you have previously created and want to use again. Look for these first in the default pathway which is C:\Program Files\JBASys21\.
These may include:

- New or changed Business Process files (*.BPR)
- New or changed Activity files (*.ACT)
- New or changed Activity List files (*.TSK)
- Modified business data contained in the JBADTime.mdb Access database.

Step 2

Uninstall any previously installed components. Please refer to Uninstalling The Software.

Step 3

Warning: Please make sure that you reboot after uninstalling.

Step 4

If you have defined business data then once the upgrade is complete you can merge your existing data into the new database by running the MergeDesignTimeDatabases application called MergeDTime.exe.

Step 5

You are now ready to install the new software. See Installing The Software.

Upgrading The Software (PIP Upgrade)

Note: A PIP upgrade is a short term improvement issued by JBA. It will be followed shortly by a full upgrade. Unless your installation disk states specifically that it is a PIP then follow the instructions for a Full Upgrade instead.

Warning: Make sure you have the correct PIP upgrade version in relation to your currently installed version. Refer to the CON352v.TXT file included on the installation CD for details (where v is the version identifier).

This is what to do:

Step 1

You may need to copy away any work files and extracts that you have previously created and want to use again. Look at the PIP disk to see what has been supplied. Only copy away those files and extracts which will be overwritten by those supplied on the PIP.

Look for the existing ones in the default pathway which is C:\Program Files\JBASys21\.
These may include:

- New or changed Business Process files (*.BPR)
- New or changed Activity files (*.ACT)
- New or changed Task List files (*.TSK)
- Modified business data contained in the JBADTime.mdb Access database.

Step 2

From the PC, make sure that Windows has been started.

Step 3

Look on your CD for the AutoInstall directory and from here run Setup.exe to start the installation.

Step 4

Online help and instructions are provided during the installation. It is most likely that you will want to accept all the default settings presented to you and need only click on the Next button each time in order to progress through the installation.

The readme file is displayed.

You can choose the destination location. The screen displays the location of System 21 Constructor on your PC. You may change this location using Browse but the system checks to see if there is a version of System 21 Constructor in this directory and if it cannot be found it displays the message:

Setup could not find JBA System 21 Constructor in this directory.

and changes the location back again.

Step 5

The installation is complete.

If you have defined business data then once the upgrade is complete you can merge your existing data into the new database by running the MergeDesignTimeDatabases application called MergeDTime.exe.

Step 6

Warning: If you uninstall Constructor, the whole of Constructor will be uninstalled, not just the PIP Upgrade.

Uninstalling The Software

Note: You need to do this before you reinstall or do a full upgrade (not a PIP Upgrade) of JBA System 21 Constructor.

Warning: If you uninstall after a PIP Upgrade then the whole of Constructor will be uninstalled, not just the PIP.

This is what to do:

Step 1

Click on Start\Settings\Control Panel and then click on the Add/Remove Programs icon. This is a standard Windows application.

All your currently installed software is listed for you.

Select JBA System 21 Constructor and click the Add/Remove button and Constructor will be uninstalled for you.

Warning: Please make sure that the Constructor Data Exchange Area application (ExpCloud.exe) is not running. This application is initiated by Constructor but remains active until your machine is rebooted or you manually end the task.

Step 2

Warning: Please make sure that you reboot after uninstalling.

Troubleshooting

If you have any problems or questions about JBA System 21 Constructor then please refer to Tips And Techniques. This gives you:

- Troubleshooting help.
- Checklists.
- Detailed background information on various subjects such as the routers, the error codes, the configuration files shipped with the product.
- Useful suggestions for making further use of the product. For example how to carry out a trace.

Tips and Techniques refers to all these three interfaces, unless an individual interface is named specifically within the text:

- System 21 Client Workspace
- System 21 Explorer
- System 21 Constructor.

Please refer to your JBA representative at JBA Product Support.
