Chapter 13

Troubleshooting (appendix)

Why Read This?

Tip: This is an appendix. Only read this if you want help quickly for a specific problem.

Warning: Before you start to enable any existing Elemental Activities please refer to the document on the installation CD called stopprss.doc. This document contains the very latest information to help you to enable existing Elemental Activities for Work Management. This will help you to select the resources you need both for programming staff and hardware and software equipment and will give you helpful reports from people with experience of enabling.

List Of Problems

See the following list for fast help.

- Activity Accidentally Cancelled Or Abnormally Ended
- Business Process Stops Unexpectedly
- Cannot Find Commands
- Cannot Remove Action List Entries
- Cannot Remove Window Listing Business Processes
- Create An Order And Next EWM Activity Does Not Run
- No Workflow Transactions Being Written
- Only First Workflow Transaction Is Written.
- Printing Incorrectly From Acrobat Viewer(.pdf)

Activity Accidentally Cancelled Or Abnormally Ended

Is the transaction status PENDING (PRIN52 = '1')?

Reissue using the EWM recovery facility.

Is the transaction status ACTIVE (PRIN52 = '2')?

Perform application specific recovery / reconciliation before reissuing using the EWM recovery facility.

Business Process Stops Unexpectedly

Is the transaction status *ACTIVE* (PRIN52 = '2')?

EWM trigger has not been processed through the engine. Look in subsystem WFBACK3 for job WF_ENGINE. If not there then the subsystem or the engine have not been started

Is the transaction status *COMPLETE* (PRIN52 = '3')?

Check the completion details in table WFP53 manually or using the Action Tracker. If completion reason is different to expected then application code is incorrect or activity completed via a different node than expected

Ensure that user who started the EWM engine is authorised to run the activity specified. If not then authorise the user and reissue using the EWM recovery facility

Cannot Find Commands

***WM or ENDWM**

If you need these please refer to the CD issued with the 3.5.2 General Availability version of the software.

Cannot Remove Action List Entries

If you want to remove all the entries on an Action List or clear down Action Tracker please refer to the following help topics, within the Getting Started chapter:

- EWM Transaction Purge And Unlock Utility
- Ending EWM Interactively From Application Manager.

Warning: You have to follow both sets of instructions.

Cannot Remove Window Listing Business Processes

Users do not execute a Business Process, they execute activities in the same way whether Work Management exists or not. It is the Server that recognises that the selected activity initiates a Business Process. The only user involvement is where the system cannot determine which Business Process to execute where more than one has been defined in relation to the executed activity.

If the currently executed activity is the Initial Activity in more than one Business Process then the user is presented with a window requesting them to select which Business Process they want to use to control the order.

If you want to remove this window then please reduce the number of enabled Business Processes for this initial activity to one by using the Manage Activated Processes option on the Work Management Menu in Constructor.

Create An Order And Next EWM Activity Does Not Run

Check all these things:

1. Does the action tracker report that the Order was entered?
2. Is the user running the correct company/environment?
3. Is the EWM engine running?
4. Are you authorised to use EWM features in Explorer? Please refer to your System Administrator or JBA representative.
5. Was the EWM engine started by someone who was authorised to all System 21 activities?
6. Is EWM authorisation code applied?
7. Is the version of the Order Entry Activity, on the server, and subsequent activities EWM enabled?
8. Is there an error on the EWM Error file (WFP97)?

No Workflow Transactions Being Written

Has activity been Work Management enabled?

If so check program calls programs WF001 and WF003. If it does not then application code requires EWM APIs included.

Has AM environment been EWM enabled?

From AS/400 command line type STRIPGAM. From displayed screen select EWM menu (option 9) and then environment details (option 7). Defined environment in AM to be active and specify WM data library.

Is activity defined to a business process

If not known, determine activity code by looking for application task on activities table WFP03. Is activity one of initial business process activities defined on table WFP20. If not then activity will never write details to the EWM tables.

Only First Workflow Transaction Is Written

Is the transaction status *ACTIVE* (PRIN52 = '2')?

EWM trigger has not been processed through the engine. Look in subsystem WFBACK3 for job WF_ENGINE. If not there then the subsystem or the engine have not been started.

Is the transaction status *COMPLETE* (PRIN52 = '3')?

Check the completion details in table WFP53 manually or using the Action Tracker. If completion reason is different to expected then application code is incorrect or activity completed via a different node than expected.

Ensure that user who started the EWM engine is authorised to run the activity specified. If not then authorise the user and reissue using the EWM recovery facility.

Printing Incorrectly From Acrobat Viewer(wm.pdf)

Potential Problem

JBA issue Help files in .pdf format, for example wm.pdf, for use with Acrobat Viewer. You can print pages directly from Acrobat Viewer, however, there may be a problem where Arial Monospaced font has been used to show excerpts of program code and the printer is not set up correctly to receive this font.

How To Resolve It

To print all fonts correctly on your printer check the following:

- That you set the PC to the correct print resolution of 300 dots per inch.
- That you only print from your hard drive or a network drive.

If you do not know how to do this then please take the following steps. You need only do this once:

1. Close Acrobat viewer.
2. Load the .pdf file onto your hard drive on the PC, or to a network drive. If the .pdf file has been sent to you via Lotus Notes then please detach to the hard drive.
3. Select Start\Settings\Printers to display the Printers Window.
4. Select your default printer and click with the right mouse button. This displays the pop up menu.
5. Select Properties from the pop up menu.
6. Select the panel with the Resolution field (usually the Graphic panel).
7. Change the Resolution to 300 dots per inch.
8. Click Apply and then click OK.
9. Open Acrobat Viewer and resume printing from your .pdf file as normal.
